

ABSTRACT

Method and apparatus for electronic data console embedded in chair module

5 The present invention relates to a method and apparatus for an electronic data console unit to be integrated into a chair device for the purposes of allowing a user to obtain electronic content via the said console in real-time while at the chair device. The said chair device is adapted to be connected to a central processor allowing the console to be controlled by the said processor, thereby allowing the said content to be purchased in real-time.
