Abstract

SYSTEMS AND DEVICES FOR MANAGING IDENTIFICATION, VERIFICATION, AND VALIDATION OF A PLURALITY OF COMPUTING DEVICES

Embodiments relate to systems for managing computing device identification. The system is configured to establish communication between a processor and computing device. The system is configured to identify an initial set of applications. The system is configured to select a group of applications from the initial set of applications. The system is configured to obtain a first metadata of each application in the group of applications. The system is configured to generate a ranked group of applications by ranking applications in the group of applications based on the first metadata. The system is configured to obtain a second metadata and third metadata of each application in the ranked group. The system is configured to generate a unique device identifier for the computing device. The unique device identifier is generated based on at least the second and third metadata of each application in the ranked group of applications.
