

ABSTRACT

The embodiments of the disclosure relate to an interaction method, apparatus, device, and storage medium. The method proposed herein includes: presenting a target interface associated with a target object; providing, in response to determining that the target object is configured with a corresponding virtual object, an access entry associated with the virtual object in the target interface; and presenting, based on a selection of the access entry, an interactive interface with the virtual object, the interactive interface being configured to support multimodal interaction between a current user and the virtual object.
