

MAIL SERVER, MAIL TRANSMITTING/RECEIVING METHOD, AND MAIL
TRANSMITTING/RECEIVING PROGRAM

ABSTRACT

5 By an email server, an email transmitting/receiving method, and an email
transmitting/receiving program according to the present invention, it becomes possible to
perform a deletion process for an email transmitted by a sender according to sender's intention
and thereby to delete the transmitted email based on that operation. An email deletion server (1)
according to the present invention includes a deletion request information storage unit (1a) that
10 stores identification information of an email and identification information of at least one
receiver of that email, the email being requested to be deleted by a sender, and an email deletion
processing unit (1D) that updates, for the email server, a process for deleting an email from a
reception email area of the receiver based on the identification information of the email and the
identification information of the receiver stored in the deletion request information storage unit
15 (1a), the email being identified by the identification information of the email and the
identification information of the receiver.
