(54) Title: MOUSE WITH CAMERA FOR SEPERATION AND ATTACHMENT

(57) Abstract: As Internet connection service through one-dimensional (1D) or two-dimensional (2D) barcode recognition becomes prevalent, barcode recognition apparatuses and methods using personal computer (PC) cameras, PDA cameras, or mobile phone cameras are being widely used. However, when barcodes are read using such cameras, the distance between a camera and a barcode as well as the focus of the camera must be manually adjusted. In addition, when a plurality of barcodes are arranged, it is difficult to choose one of them. Provided is a mouse into or from which a camera can be inserted or removed. The mouse includes space into or from which a camera can be inserted or removed and a window in a bottom thereof such that an external image input to the mouse through the window can be reflected within the mouse and then reach a lens of the camera inserted therein. Therefore, the camera can be inserted or removed from the mouse, and both the mouse and

the camera functions can be used simultaneously
