

ABSTRACT

5 A taping apparatus includes a pressing member for pressing one of a carrier tape and a cover tape against the other at a bonding position so as to perform bonding, a transfer mechanism that transfers the carrier tape in a state where the carrier tape is provided with a tension region along a range from an upstream side of a joining position to a downstream side of the bonding position, an upper guide disposed above the tension region, and a push-up mechanism configured to press the tension region entirely or partially against the upper guide from below.
