

COMPOUNDS AND COMPOSITIONS AS PROTEIN KINASE INHIBITORS

Cross-Reference to Related Applications

[0001] This application claims priority benefit of U.S. provisional application serial no. 60/869,299, filed December 8, 2006.

Technical Field

[0002] The invention relates to protein kinase inhibitors, more particularly novel pyrimidine and pyridine derivatives and pharmaceutical compositions thereof, and their use as pharmaceuticals.

Background Art

[0003] Anaplastic lymphoma kinase (ALK), a member of the insulin receptor superfamily of receptor tyrosine kinases, has been implicated in oncogenesis in hematopoietic and non-hematopoietic tumors. The aberrant expression of full-length ALK receptor proteins has been reported in neuroblastomas and glioblastomas; and ALK fusion proteins have occurred in anaplastic large cell lymphoma. The study of ALK fusion proteins has also raised the possibility of new therapeutic treatments for patients with ALK-positive malignancies. (Pulford et al., Cell. Mol. Life Sci. 61:2939-2953 (2004)).

[0004] Focal Adhesion Kinase (FAK) is a key enzyme in the integrin-mediated outside-in signal cascade (D. Schlaepfer et al., Prog Biophys Mol Biol 1999, 71, 43578). The trigger in the signal transduction cascade is the autophosphorylation of Y397. Phosphorylated Y397 is a SH2 docking site for Src family tyrosine kinases; the bound c-Src kinase phosphorylates other tyrosine residues in FAK. Among them, phosphorylated Y925 becomes a binding site for the SH2 site of Grb2 small adaptor protein. This direct binding of Grb2 to FAK is one of the key steps for the activation of down stream targets such as the Ras-ERK2/MAP kinase cascade.

[0005] Zeta-chain-associated protein kinase 70 (ZAP-70), a member of the protein tyrosine kinase family, is of potential prognostic importance in chronic lymphocytic leukemia (CLL). ZAP-70, known to be of importance in T and NK cell signaling but absent in normal peripheral B cells, is expressed in the majority of the poorer prognosis unmutated CLL and absent in most cases with mutated IgVH genes. ZAP-70 is also expressed in a minority of other B cell tumors. (Orchard et al., Leuk. Lymphoma 46:1689-98 (2005)).

[0006] Insulin-like growth factor (IGF-1) signaling is highly implicated in cancer, with the IGF-1 receptor (IGF-1R) as the predominating factor. IGF-1R is important for tumor transformation and survival of malignant cells, but is only partially involved in normal cell growth. Targeting of IGF-1R has been suggested to be a promising option for cancer therapy. (Larsson et al., Br. J. Cancer 92:2097-2101 (2005)).

[0007] Because of the emerging disease-related roles of ALK, FAK, ZAP-70 and IGF-1R, there is a continuing need for compounds which may be useful for treating and preventing a disease which responds to inhibition of ALK, FAK, ZAP-70 and/or IGF-1R.

Pharmacology and Utility

[0039] The compounds of the invention and their pharmaceutically acceptable salts exhibit valuable pharmacological properties when tested in vitro in cell-free kinase assays and in cellular assays, and are therefore useful as pharmaceuticals.

[0040] In one aspect, compounds of Formula (1), (2), (3A), (3B), (4A), (4B) or (5) may inhibit the tyrosine kinase activity of anaplastic lymphoma kinase (ALK) and the fusion protein of NPM-ALK. This protein tyrosine kinase results from a gene fusion of nucleophosmin (NPM)

and ALK, rendering the protein tyrosine kinase activity of ALK ligand independent. NPM-ALK plays a key role in signal transmission in a number of hematopoietic and other human cells leading to hematological and neoplastic diseases, for example in anaplastic large-cell lymphoma (ALCL) and non-Hodgkin's lymphomas (NHL), specifically in ALK+NHL or Alkomas, in inflammatory myofibroblastic tumors (IMT) and neuroblastomas. (Duyster et al. 2001 Oncogene 20, 5623-5637). In addition to NPM-ALK, other gene fusions have been identified in human hematological and neoplastic diseases; for example, TPM3-ALK (a fusion of nonmuscle tropomyosin with ALK).

[0041] The inhibition of ALK tyrosine kinase activity may be demonstrated using known methods, for example using the recombinant kinase domain of the ALK in analogy to the VEGF-R kinase assay described in J. Wood et al. Cancer Res. 60, 2178-2189 (2000). In general, in vitro enzyme assays using GST-ALK protein tyrosine kinase are performed in 96-well plates as a filter binding assay in 20 mM Tris HCl, pH = 7.5, 3 mM MgCl₂, 10 mM MnCl₂, 1 mM DTT, 0.1 µCi/assay (=30 µl) [γ -³³P]-ATP, 2 µM ATP, 3 µg/mL poly (Glu, Tyr 4:1) Poly-EY (Sigma P-0275), 1 % DMSO, 25 ng ALK enzyme. Assays are incubated for 10 min at ambient temperature. Reactions are terminated by adding 50 µl of 125 mM EDTA, and the reaction mixture is transferred onto a MAIP Multiscreen plate (Millipore, Bedford, MA, USA), previously wet with methanol, and rehydrated for 5 min with H₂O. Following washing (0.5 % H₃PO₄), plates are counted in a liquid scintillation counter. IC₅₀ values are calculated by linear regression analysis of the percentage inhibition.

[0042] Compounds of Formula (1), (2), (3A), (3B), (4A), (4B) or (5) may potentially inhibit the growth of human NPM-ALK overexpressing murine BaF3 cells (DSMZ Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH, Germany). The expression of NPM-ALK may be achieved by transfecting the BaF3 cell line with an expression vector pCIneoTM (Promega Corp., Madison WI, USA) coding for NPM-ALK and subsequent selection of G418 resistant cells. Non-transfected BaF3 cells depend on IL-3 for cell survival. In contrast, NPM-ALK expressing BaF3 cells (named BaF3-NPM-ALK hereinafter) can proliferate in the absence of IL-3 because they obtain proliferative signal through NPM-ALK kinase. Putative inhibitors of the NPM-ALK kinase therefore abolish the growth signal and may result in antiproliferative activity. The antiproliferative activity of putative inhibitors of the NPM-ALK kinase can however be overcome by addition of IL-3, which provides growth signals through an NPM-

ALK independent mechanism. An analogous cell system using FLT3 kinase has also been described (see, E Weisberg et al. Cancer Cell; 1, 433-443 (2002)).

[0043] The inhibitory activity of the compounds of the invention may be determined as follows. In general, BaF3-NPM-ALK cells (15,000/microtitre plate well) are transferred to 96-well microtitre plates. Test compounds dissolved in dimethyl sulfoxide (DMSO) are added in a series of concentrations (dilution series) in such a manner that the final concentration of DMSO is not greater than 1 % (v/v). After the addition, the plates are incubated for two days during which the control cultures without test compound are able to undergo two cell-division cycles. The growth of the BaF3-NPM-ALK cells is measured by means of YOPRO™ staining [T Idziorek et al. J. Immunol. Methods; 185: 249-258 (1995)]: 25 µl of lysis buffer comprising 20 mM sodium citrate, pH 4.0, 26.8 mM sodium chloride, 0.4 % NP40, 20 mM EDTA and 20 mM is added to each well. Cell lysis is completed within 60 min at room temperature and total amount of YOPRO™ bound to DNA is determined by measurement using the Cytofluor II 96-well reader (PerSeptive Biosystems) with the following settings: Excitation (nm) 485/20 and Emission (nm) 530/25.

[0044] IC₅₀ values may be determined by a computer-aided system using the formula:

$$IC_{50} = [(ABS_{test} - ABS_{start}) / (ABS_{control} - ABS_{start})] \times 100. \text{ (ABS = absorption)}$$

[0045] The IC₅₀ value in those experiments is given as that concentration of the test compound in question that results in a cell count that is 50 % lower than that obtained using the control without inhibitor. The compounds of the invention in free form or in pharmaceutically acceptable salt form, may exhibit valuable pharmacological properties, for example, as indicated by the *in vitro* tests described in this application. In general, compounds of the invention have IC₅₀ values from 1 nM to 10 µM. In some examples, compounds of the invention have IC₅₀ values from 0.01 µM to 5 µM. In other examples, compounds of the invention have IC₅₀ values from 0.01 µM to 1 µM, or more particularly from 1 nM to 1 µM. In yet other examples, compounds of the invention have IC₅₀ values of less than 1 nM or more than 10 µM. The compounds of the invention may exhibit a percentage inhibition of greater than 50%, or in other embodiments, may exhibit a percentage inhibition greater than about 70%, against ALK at 10 µM.

[0046] The antiproliferative action of the inventive compounds may also be determined in the human KARPAS-299 lymphoma cell line (DSMZ Deutsche Sammlung von Mikroorganismen und Zellkulturen GmbH, Braunschweig, Germany, described in WG Dirks et

al. Int. J. Cancer 100, 49-56 (2002)) using the same methodology described above for the BaF3-NPM-ALK cell line. In some embodiments, compounds of the invention may exhibit inhibitory activity with an IC_{50} in the range from approximately 0.01 to 1 μ M. The action of the inventive compounds on autophosphorylation of the ALK may be determined in the human KARPAS-299 lymphoma cell line by means of an immunoblot as described in WG Dirks et al. Int. J. Cancer 100, 49-56 (2002).

[0047] In another aspect, the compounds of the invention may inhibit Focal Adhesion Kinase (FAK), and may be useful as pharmaceuticals to treat conditions caused by a malfunction of signal cascades connected with FAK, such as in the treatment of particular tumors. The inhibition of endogenous FAK signaling results in reduced motility, and in some cases induces cell death. On the other hand, enhancing FAK signaling by exogenous expression increases cell motility. In addition, FAK is overexpressed in invasive and metastatic epithelial, mesenchymal, thyroid and prostate cancers. Consequently, an inhibitor of FAK is likely to be a drug for anti-tumor growth and metastasis. The compounds of the invention may thus be useful to prevent and/or treat a vertebrate and more particularly a mammal, affected by a neoplastic disease, in particular breast tumor, cancer of the bowel (colon and rectum), stomach cancer and cancer of the ovary and prostate, non-small cell lung cancer, small cell lung cancer, cancer of liver, melanoma, bladder tumor and cancer of head and neck.

[0048] The relation between FAK inhibition and immuno-system is described e.g. in G.A. van Seventer et al., Eur. J. Immunol. 2001, 31, 1417-1427. Therefore, the compounds of the invention are, for example, useful to prevent and/or treat a vertebrate and more particularly a mammal, affected by immune system disorders, diseases or disorders mediated by T lymphocytes, B lymphocytes, mast cells and/or eosinophils e.g. acute or chronic rejection of organ or tissue allo- or xenografts, atherosclerosis, vascular occlusion due to vascular injury such as angioplasty, restenosis, hypertension, heart failure, chronic obstructive pulmonary disease, CNS disease such as Alzheimer disease or amyotrophic lateral sclerosis; cancer; infectious disease such as AIDS; septic shock or adult respiratory distress syndrome, ischemia/reperfusion injury e.g. myocardial infarction, stroke, gut ischemia, renal failure or hemorrhage shock, or traumatic shock.

[0049] In yet another aspect, the compounds of the invention may inhibit zeta chain-associate protein 70 (ZAP-70). ZAP-70 protein tyrosine kinase interaction of the agents of the invention may be demonstrated, for example, by their ability to prevent phosphorylation of

LAT-11 (linker for activation of T cell) by human ZAP-70 protein tyrosine kinase in aqueous solution. Therefore, the compounds of the invention may be useful for the prevention or treatment of disorders or diseases where ZAP-70 inhibition plays a role.

[0050] The compounds of the invention may also inhibit insulin like growth-factor receptor 1 (IGF-1R), and may be useful in the treatment of IGF-1 R mediated diseases. Examples of IGF-1R mediated diseases include but are not limited to proliferative diseases, such as tumors, for example breast, renal, prostate, colorectal, thyroid, ovarian, pancreas, neuronal, lung, uterine and gastro intestinal tumors, as well as osteosarcomas and melanomas. The efficacy of the compounds of the invention as inhibitors of IGF-1R tyrosine kinase activity may be demonstrated using a cellular capture ELISA. In this assay, the activity of the compounds of the invention against (IGF-1)-induced autophosphorylation of the IGF-1R is determined.

[0051] The compounds of the invention may also be useful in the treatment and/or prevention of acute or chronic inflammatory diseases or disorders or autoimmune diseases e.g. rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, myasthenia gravis, diabetes (type I and II) and the disorders associated therewith, respiratory diseases such as asthma or inflammatory liver injury, inflammatory glomerular injury, cutaneous manifestations of immunologically-mediated disorders or illnesses, inflammatory and hyperproliferative skin diseases (such as psoriasis, atopic dermatitis, allergic contact dermatitis, irritant contact dermatitis and further eczematous dermatitis, seborrhoeic dermatitis), s inflammatory eye diseases, e.g. Sjogren's syndrome, keratoconjunctivitis or uveitis, inflammatory bowel disease, Crohn's disease or ulcerative colitis.

Administration and Pharmaceutical Compositions

[0053] In general, compounds of the invention will be administered in therapeutically effective amounts via any of the usual and acceptable modes known in the art, either singly or in combination with one or more therapeutic agents. A therapeutically effective amount may vary widely depending on the severity of the disease, the age and relative health of the subject, the potency of the compound used and other factors known to those of ordinary skill in the art. For example, for the treatment of neoplastic diseases and immune system disorders, the required

[0054] In general, satisfactory results are indicated to be obtained systemically at daily dosages of from about 0.01 to about 100 mg/kg per body weight, or particularly, from about 0.03 to 2.5 mg/kg per body weight. An indicated daily dosage in the larger mammal, e.g. humans, may be in the range from about 0.5 mg to about 2000 mg, or more particularly, from about 0.5 mg to about 100 mg, conveniently administered, for example, in divided doses up to four times a day or in retard form. Suitable unit dosage forms for oral administration comprise from ca. 1 to 50 mg active ingredient.

[0056] Pharmaceutical compositions comprising a compound of the present invention in free form or in a pharmaceutically acceptable salt form in association with at least one pharmaceutically acceptable carrier or diluent may be manufactured in a conventional manner by mixing, granulating, coating, dissolving or lyophilizing processes. For example, pharmaceutical compositions comprising a compound of the invention in association with at least one pharmaceutical acceptable carrier or diluent may be manufactured in conventional manner by mixing with a pharmaceutically acceptable carrier or diluent. Unit dosage forms for oral administration contain, for example, from about 0.1 mg to about 500 mg of active substance.

The solutions or suspensions may further comprise viscosity-increasing agents, including but not limited to, sodium

carboxymethylcellulose, carboxymethylcellulose, dextran, polyvinylpyrrolidone, gelatins, or solubilizers, e.g. Tween 80 (polyoxyethylene(20)sorbitan mono-oleate).

[0058] Suspensions in oil may comprise as the oil component the vegetable, synthetic, or semi-synthetic oils customary for injection purposes. The alcohol component of these fatty acid esters may have six carbon atoms and may be monovalent or polyvalent, for example a mono-, di- or trivalent, alcohol. Suitable alcohol components include but are not limited to methanol, ethanol, propanol, butanol or pentanol or isomers thereof; glycol and glycerol.

[0059] Other suitable fatty acid esters include but are not limited ethyl-oleate, isopropyl myristate, isopropyl palmitate, LABRAFIL® M 2375, (polyoxyethylene glycerol), LABRAFIL® M 1944 CS (unsaturated polyglycolized glycerides prepared by alcoholysis of apricot kernel oil and comprising glycerides and polyethylene glycol ester), LABRASOL™ (saturated polyglycolized glycerides prepared by alcoholysis of TCM and comprising glycerides and polyethylene glycol ester; all available from GaKefosse, France), and/or MIGLYOL® 812 (triglyceride of saturated fatty acids of chain length C₈ to C₁₂ from Hüls AG, Germany), and vegetable oils such as cottonseed oil, almond oil, olive oil, castor oil, sesame oil, soybean oil, or groundnut oil.

[0060] Pharmaceutical compositions for oral administration may be obtained, for example, by combining the active ingredient with one or more solid carriers, and if desired, granulating a resulting mixture, and processing the mixture or granules by the inclusion of additional excipients, to form tablets or tablet cores.

desired, disintegrators, such as the above-mentioned starches, carboxymethyl starch, crosslinked polyvinylpyrrolidone, alginic acid or a salt thereof, such as sodium alginate. Additional excipients include flow conditioners and lubricants, for example silicic acid, talc, stearic acid or salts thereof, such as magnesium or calcium stearate, and/or polyethylene glycol, or derivatives thereof.

[0062] Tablet cores may be provided with suitable, optionally enteric, coatings through the use of, inter alia, concentrated sugar solutions which may comprise gum arabic, talc, polyvinylpyrrolidone, polyethylene glycol and/or titanium dioxide, or coating solutions in suitable organic solvents or solvent mixtures, or, for the preparation of enteric coatings, solutions of suitable cellulose preparations, such as acetylcellulose phthalate or hydroxypropylmethylcellulose phthalate. Dyes or pigments may be added to the tablets or tablet coatings, for example for identification purposes or to indicate different doses of active ingredient.

[0063] Pharmaceutical compositions for oral administration may also include hard capsules comprising gelatin or soft-sealed capsules comprising gelatin and a plasticizer, such as glycerol or sorbitol. The hard capsules may contain the active ingredient in the form of granules, for example in admixture with fillers, such as corn starch, binders, and/or glidants, such as talc or magnesium stearate, and optionally stabilizers. In soft capsules, the active ingredient may be dissolved or suspended in suitable liquid excipients, such as fatty oils, paraffin oil or liquid polyethylene glycols or fatty acid esters of ethylene or propylene glycol, to which stabilizers and detergents, for example of the polyoxyethylene sorbitan fatty acid ester type, may also be added.

[0064] Pharmaceutical compositions suitable for rectal administration are, for example, suppositories comprising a combination of the active ingredient and a suppository base. Suitable suppository bases are, for example, natural or synthetic triglycerides, paraffin hydrocarbons, polyethylene glycols or higher alkanols.

The active ingredient, optionally together with excipients, can also be in the form of a lyophilizate and can be made into a solution before parenteral administration by the addition of suitable solvents. Solutions such as are used, for example, for parenteral administration can also be employed as

infusion solutions. The manufacture of injectable preparations is usually carried out under sterile conditions, as is the filling, for example, into ampoules or vials, and the sealing of the containers.

[0066] The compounds of the invention may be administered as the sole active ingredient, or together with other drugs useful against neoplastic diseases or useful in immunomodulating regimens. The kit can comprise instructions for its administration.

Processes for Making Compounds of the Invention

[0068] Compounds of Formula (1) may be prepared following Reaction Scheme I, in which each substituent is as defined in the Summary of the Invention:

[0069] A compound of Formula (1) may be synthesized by reacting a compound of formula (6) with a compound of formula (7) in the presence of palladium catalyst (for example palladium acetate and the like), ligand (for example xantphos and the like) and base (for example cesium carbonate and the like) in a suitable solvent (for example, THF, and the like). The reaction proceeds in a temperature range of about 70°C to about 180°C and can take 10 min. to 8 hours to complete.

[0070] Alternatively, a compound of Formula (1) may be synthesized by reacting a compound of formula (6) with a compound of formula (7) in the presence of acid (for example HCl, TsOH and the like), in a suitable solvent (for example, 2-propanol, and the like). The reaction proceeds in a temperature range of about 70°C to about 150°C and can take up to 12 hours to complete.

Additional Processes for Making Compounds of the Invention

[0071] The compounds of the invention, including their salts, are also obtainable in the form of hydrates, or their crystals may include for example the solvent used for crystallization (present as solvates). Salts can usually be converted to compounds in free form, e.g., by treating with suitable basic agents, for example with alkali metal carbonates, alkali metal hydrogen carbonates, or alkali metal hydroxides, such as potassium carbonate or sodium hydroxide. In view of the close relationship between the novel compounds in free form and those in the form of their salts, including those salts that may be used as intermediates, for example in the purification or identification of the novel compounds, any reference to the free compounds hereinbefore and hereinafter is to be understood as referring also to the corresponding salts, as appropriate.

[0072] Salts of the inventive compounds with a salt-forming group may be prepared in a manner known per se. Acid addition salts of compounds of Formula (1), (2), (3A), (3B), (4A), (4B) or (5) may thus be obtained by treatment with an acid or with a suitable anion exchange reagent. Pharmaceutically acceptable salts of the compounds of the invention may be formed, for example, as acid addition salts, with organic or inorganic acids, from compounds of Formula (1), (2), (3A), (3B), (4A), (4B) or (5) with a basic nitrogen atom.

[0073] Suitable inorganic acids include, but are not limited to, halogen acids, such as hydrochloric acid, sulfuric acid, or phosphoric acid. Suitable organic acids include, but are not limited to, carboxylic, phosphoric, sulfonic or sulfamic acids, for example acetic acid, propionic

acid, octanoic acid, decanoic acid, dodecanoic acid, glycolic acid, lactic acid, fumaric acid, succinic acid, adipic acid, pimelic acid, suberic acid, azelaic acid, -malic acid, tartaric acid, citric acid, amino acids, such as glutamic acid or aspartic acid, maleic acid, hydroxymaleic acid, methylmaleic acid, cyclohexanecarboxylic acid, adamantanecarboxylic acid, benzoic acid, salicylic acid, 4 aminosalicylic acid, phthalic acid, phenylacetic acid, mandelic acid, cinnamic acid, methane-or ethane-sulfonic acid, 2-hydroxyethanesulfonic acid, ethane-1,2-disulfonic acid, benzenesulfonic acid, 2-naphthalenesulfonic acid, 1,5-naphthalene-disulfonic acid, 2-, 3-or 4 methylbenzenesulfonic acid, methylsulfuric acid, ethylsulfuric acid, dodecylsulfuric acid, N cyclohexylsulfamic acid, N-methyl-, N-ethyl-or N-propyl-sulfamic acid, or other organic protonic acids, such as ascorbic acid.

[0074] For isolation or purification purposes, it is also possible to use pharmaceutically unacceptable salts, for example picrates or perchlorates. For therapeutic use, only pharmaceutically acceptable salts or free compounds are employed (where applicable in the form of pharmaceutical preparations).

[0075] Compounds of the invention in unoxidized form may be prepared from N-oxides of compounds of the invention by treating with a reducing agent (e.g., sulfur, sulfur dioxide, triphenyl phosphine, lithium borohydride, sodium borohydride, phosphorus trichloride, tribromide, or the like) in a suitable inert organic solvent (e.g. acetonitrile, ethanol, aqueous dioxane, or the like) at 0 to 80°C.

[0076] Prodrug derivatives of the compounds of the invention may be prepared by methods known to those of ordinary skill in the art (e.g., for further details see Saulnier et al., (1994), Bioorganic and Medicinal Chemistry Letters, Vol. 4, p. 1985). For example, appropriate prodrugs may be prepared by reacting a non-derivatized compound of the invention with a suitable carbamylating agent (e.g., 1,1-acyloxyalkylcarbanochloridate, para-nitrophenyl carbonate, or the like).

[0077] Protected derivatives of the compounds of the invention may be made by means known to those of ordinary skill in the art. A detailed description of techniques applicable to the creation of protecting groups and their removal may be found in T. W. Greene, "Protecting Groups in Organic Chemistry", 3rd edition, John Wiley and Sons, Inc., 1999.

[0078] Compounds of the invention may be prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereoisomeric compounds, separating the diastereomers and recovering the optically

pure enantiomers. Resolution of enantiomers may be carried out using covalent diastereomeric derivatives of the compounds of the invention, or by using dissociable complexes (e.g., crystalline diastereomeric salts). Diastereomers have distinct physical properties (e.g., melting points, boiling points, solubilities, reactivity, etc.) and may be readily separated by taking advantage of these dissimilarities. The diastereomers may be separated by fractionated crystallization, chromatography, or by separation/resolution techniques based upon differences in solubility. The optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization. A more detailed description of the techniques applicable to the resolution of stereoisomers of compounds from their racemic mixture may be found in Jean Jacques, Andre Collet, Samuel H. Wilen, "Enantiomers, Racemates and Resolutions", John Wiley And Sons, Inc., 1981.

[0079] In summary, the compounds of the invention may be made by a process, which involves:

- (a) that of Reaction Scheme I; and
- (b) optionally converting a compound of the invention into a pharmaceutically acceptable salt;
- (c) optionally converting a salt form of a compound of the invention to a non-salt form;

Steps 1 and 2: 4-(2-Chloro-4-isopropoxy-5-nitro-benzoylamino)-piperidine-1-carboxylic acid tert-butyl ester

[0089] To a solution of 2-chloro-4-isopropoxy-5-nitro-benzoic acid (**Intermediate 8**, 10 g, 38.5 mmol) in DCM (200 mL) and DMF (1mL), is slowly added thionyl chloride (9.17 g, 77 mmol) via a syringe. The mixture is stirred for 3 hours, and is then concentrated to dryness. The obtained white solid, 2-chloro-4-isopropoxy-5-nitro-benzoyl chloride, is dried under vacuum. To a mixture of 4-amino-piperidine-1-carboxylic acid tert-butyl ester (1.44g, 7.2 mmol) and triethylamine (3 mL, 21.6 mmol) in DCM (100 mL), is slowly added 2-chloro-4-isopropoxy-5-nitro-benzoyl chloride (2g, 7.2 mmol) dissolved in DCM (10 mL) via syringe. The mixture is stirred at room temperature for 3 hours, and then is concentrated. The obtained solid is dissolved in ethyl acetate and is washed with water and brine respectively. After evaporation of the solvent, the title compound is obtained as light yellow solid, and is directly used for the next step without further purification.

Step 3: 4-(4-Isopropoxy-5-nitro-2-vinyl-benzoylamino)-piperidine-1-carboxylic acid tert-butyl ester

[0090] To a mixture of 4-(2-chloro-4-isopropoxy-5-nitro-benzoylamino)-piperidine-1-carboxylic acid tert-butyl ester (7.2 mmol) obtained in the previous step, vinylboronic acid dibutyl ester (1.72 g, 9.4 mmol) and sodium carbonate (5.34 g, 50.4 mmol) in THF/H₂O (100/25 mL) is added dichlorobis(triphenylphosphine) palladium (II) (442 mg, 5% mmol). The mixture is purged with N₂ for 3 min and heated at 90°C under N₂ for overnight in a round bottom flask equipped with a condenser. The mixture is cooled to room temperature and poured into saturated aqueous ammonia chloride solution. The mixture is extracted with ethyl acetate (3 x 100 mL). The organic extracts are combined, washed with brine and concentrated. The crude product is purified with silica gel column chromatography (40% ethyl acetate in hexanes) to afford 4-(4-isopropoxy-5-nitro-2-vinyl-benzoylamino)-piperidine-1-carboxylic acid tert-butyl ester as white solid.

Steps 4, 5 and 6: 4-(5-Isopropoxy-6-nitro-1-oxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester

[0091] 4-(4-Isopropoxy-5-nitro-2-vinyl-benzoylamino)-piperidine-1-carboxylic acid tert-butyl ester obtained from previous step (1.9 g, 4.38mmol) is dissolved in DCM (100 mL) and is cooled to -78 °C. O₃ (g) is bubbled into the solution until the solution's color turns blue/gray. The solution is then purged with N₂ (g) until the blue color disappears. The solution is warmed to room temperature and treated with triphenyl phosphine resin (5 g) pre-swelled in DCM (100

mL). After 30 min, the mixture is filtered, the filtrate is concentrated, and the resulting residue dissolved in DCM/TFA (100mL / 25 mL). To this mixture is added triethyl silane (4.6 mL, 17.5 mmol). The resulting mixture is stirred at room temperature overnight. The reaction mixture is concentrated and re-dissolved in DCM. The DCM solution is washed with 1N aqueous HCl (3 x 20 mL). The combined aqueous layer is treated with conc. aqueous NaOH until pH =12. The aqueous layer is extracted with ethyl acetate (3 x 30 mL). The combined organic layers are washed with brine, and dried over sodium sulfate. A light yellow solid is obtained after evaporation of the organic solvent.

[0092] The solid is dissolved in a mixture of methanol and triethylamine (100mL, 9:1 v/v). To this mixture is added di-tert-butyl dicarbonate (680 mg, 3.1mmol). After stirring at 50 °C for 30 minutes, the mixture is concentrated and purified by silica gel flash column chromatography (eluent: 40~50% ethyl acetate in hexanes) to afford 4-(5-Isopropoxy-6-nitro-1-oxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester as a white solid. ¹H NMR (400 MHz, CDCl₃) δ 8.19 (s, 1H), 7.11 (s, 1H), 4.74 (q, 1H), 4.45-4.38 (m, 1H), 4.35 (s, 2H), 2.90-2.80 (m, 2H), 1.85-1.81 (m, 2H), 1.66-1.63 (m, 2H), 1.48 (s, 9H), 1.42 (d, 6H).

Steps 7, 8 and 9

[0093] To a solution of 4-(5-isopropoxy-6-nitro-1-oxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester from the previous step (850 mg, 2mmol) in methanol, is added Pd/C (10% on carbon, 100 mg). The mixture is hydrogenated under 1 atm of hydrogen gas. After 4 hours, the mixture is filtered and concentrated. The obtained aniline, as yellow solid, is used for next step without additional purification. To a mixture of the crude product (2 mmol) from previous step, (2,5-dichloro-pyrimidin-4-yl)-[2-(propane-2-sulfonyl)-phenyl]-amine (**Intermediate 2**, 770mg, 2.2 mmol), cesium carbonate (1.3g, 4mmol), and xantphos (115 mg, 0.2mmol) in THF (20 mL), is added palladium acetate (22mg, 5% mmol) in a microwave tube. The mixture is purged with N₂ for 3 min. The sealed tube is heated at 150°C for 20 min under microwave irradiation. The mixture is cooled, filtered and concentrated. The residue is purified by silica gel flash column chromatography (eluent: 65% ethyl acetate in hexanes) to afford a yellow solid. The solid is treated with DCM/TFA (1/1, 10mL) for 1 hour followed by concentration under vacuum. Final purification using preparative RP LC-MS affords 6-{5-Chloro-4-[2-(propane-2-sulfonyl)-phenylamino]-pyrimidin-2-ylamino}-5-isopropoxy-2-piperidin-4-yl-2,3-dihydro-isoindol-1-one (**178**) as a white solid. ¹H NMR (400

MHz, CDCl_3) δ 10.38 (s, 1H), 10.13 (s, 1H), 9.60-9.50 (br, 1H), 9.34-9.21 (br, 1H), 8.46 (d, 1H), 8.26 (s, 1H), 8.08 (s, 1H), 7.91 (dd, 1H), 7.71 (m, 1H), 7.34 (t, 1H), 7.03 (s, 1H), 4.30 (m, 1H), 4.53 (m, 1H), 4.33 (s, 2H), 3.62 (m, 2H), 3.21-3.09 (m, 3H), 2.31-2.21 (m, 2H), 2.09-2.05 (m, 2H), 1.41 (d, 6H), 2.30 (d, 6H); ESMS m/z 599.2 ($M + H^+$).

5-{5-Chloro-4-[2-(propane-2-sulfonyl)-phenylamino]-pyrimidin-2-ylamino}-6-isopropoxy-2-(1-methyl-piperidin-4-yl)-isoindole-1,3-dione (**176**)

Step 1: 4-(1-Hydroxy-6-isopropoxy-5-nitro-3-oxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester

[0123] 4-(4-Isopropoxy-5-nitro-2-vinyl-benzoylamino)-piperidine-1-carboxylic acid tert-butyl ester (**Example 1, Step 3**, 1.2 g, 2.77 mmol) dissolved in 50 mL of DCM is cooled to -78 °C. Ozone gas is bubbled through this solution until the starting material is consumed and then nitrogen gas is bubbled through the solution for 5 min. The reaction mixture is warmed to room temperature. Triphenylphosphine-resin (2.77 g) in 10 mL of DCM is added and the resulting mixture is stirred for 1.5 h. The resin is removed by filtration and the filtrate is concentrated. Silica gel chromatography (5% MeOH in DCM) affords 4-(1-hydroxy-6-isopropoxy-5-nitro-3-oxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester; MS m/z 336.2 (M-Boc + H⁺).

Steps 2, 3 and 4: 5-Isopropoxy-2-(1-methyl-piperidin-4-yl)-6-nitro-indan-1,3-dione

[0124] To the solution of 4-(1-hydroxy-6-isopropoxy-5-nitro-3-oxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester from the previous step (173.9 mg, 0.4 mmol) in DMF (4 mL) is added pyridinium dichromate (286.5 mg, 0.8 mmol) in one portion. After stirring at room temperature for 2 h, the reaction mixture is poured into 25 mL of water and the product is extracted with EtOAc. The organic extracts are dried over Na₂SO₄, filtered and

concentrated *in vacuo* to give crude 4-(5-isopropoxy-6-nitro-1,3-dioxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester, which is directly used in the next step without further purification.

[0125] To a solution of 4-(5-isopropoxy-6-nitro-1,3-dioxo-1,3-dihydro-isoindol-2-yl)-piperidine-1-carboxylic acid tert-butyl ester generated in the previous step in 3 mL of DCM is added TFA (3 mL). The reaction mixture is stirred at room temperature for 1 h. After concentration, water (5 mL) is added to the crude reaction mixture, the resulting mixture is neutralized to pH=8 by adding NaHCO₃, and the product is extracted with DCM. The organic extracts are dried over Na₂SO₄, filtered and concentrated *in vacuo* to give crude 5-isopropoxy-6-nitro-2-piperidin-4-yl-isoindole-1,3-dione, which is directly used in the next step without further purification.

[0126] To a solution of the 5-isopropoxy-6-nitro-2-piperidin-4-yl-isoindole-1,3-dione generated in the previous step in THF (5 mL) and methanol (5 mL) are added formaldehyde (30 μ L, 0.4 mmol) and 2 drops of AcOH sequentially. The reaction mixture is stirred at room temperature for 1h, then sodium cyanoborohydride (50.4 mg, 0.8 mmol) is added in one portion and the resulting mixture is stirred for an additional 30 min. The reaction is quenched by the addition of saturated aqueous NH₄Cl followed by concentration *in vacuo* to give an oily residue. This oil is partitioned between EtOAc and brine. The organic extract is dried over Na₂SO₄, filtered and concentrated. Silica gel chromatography (5% MeOH in DCM) affords 5-isopropoxy-2-(1-methyl-piperidin-4-yl)-6-nitro-indan-1,3-dione; MS m/z 347.2 (M+1).

Example 17

Methyl 4'-(5-chloro-4-(2-(isopropylsulfonyl)phenylamino)pyridin-2-ylamino)-5'-methoxy-2'-methylbiphenyl-4-carboxylate (254)

Step 1: Methyl 4'-amino-5'-methoxy-2'-methylbiphenyl-4-carboxylate

[0138] Methyl 4'-amino-5'-methoxy-2'-methylbiphenyl-4-carboxylate; MS m/z 272.1 (M+1), may be synthesized following the procedures previously described (**Example 7, Steps 1 and 2**) using appropriate reagents.

Step 2: Methyl 4'-(4-bromo-5-chloropyridin-2-ylamino)-5'-methoxy-2'-methylbiphenyl-4-carboxylate

[0139] Methyl 4'-amino-5'-methoxy-2'-methylbiphenyl-4-carboxylate generated in Step 1 (200 mg, 0.75 mmol), 2,4-dibromo-5-chloropyridine (222 mg, 0.82 mmol, 1.1 equiv), Pd₂(dba)₃ (17 mg, 0.02 mmol, 0.025 equiv.), xantphos (22 mg, 0.04 mmol, 0.05 equiv.), and Cs₂CO₃ (365 mg, 1.1 mmol, 1.5 equiv.) are added to THF (5 mL). The resulting mixture is bubbled with N₂ gas for 5 minutes and then heated at 150 °C for 4 hours. After cooling to room temperature, the reaction mixture is diluted into EtOAc and washed with H₂O. The EtOAc layer is dried over Mg₂SO₄ and concentrated *in vacuo*. Silica gel chromatography (hexanes-EtOAc) affords Methyl 4'-(4-bromo-5-chloropyridin-2-ylamino)-5'-methoxy-2'-methylbiphenyl-4-carboxylate; MS m/z 461.0 (M+1).

Step 3: Methyl 4'-(5-chloro-4-(2-(isopropylsulfonyl)phenylamino)pyridin-2-ylamino)-5'-methoxy-2'-methylbiphenyl-4-carboxylate (254)

[0140] Methyl 4'-(4-bromo-5-chloropyridin-2-ylamino)-5'-methoxy-2'-methylbiphenyl-4-carboxylate generated in Step 2 (9 mg, 0.022 mmol), 2-(isopropylsulfonyl)aniline (4 mg, 0.022 mmol, 1 equiv), Pd₂(dba)₃ (1.7 mg, 0.002 mmol, 0.1 equiv.), 2-(Dicyclohexylphosphino)-2',4',6'-tri-*i*-propyl-1,1'-biphenyl (1.8 mg, 0.004 mmol, 0.2 equiv.), and Sodium tert-butoxide (2.7 mg, 0.028 mmol, 1.3 equiv.) are added to THF (1 mL). The resulting mixture is bubbled with N₂ gas for 5 minutes and then heated at 150 °C for 4 hours. After cooling to room temperature, the reaction mixture is diluted into EtOAc and washed with H₂O. The EtOAc layer is dried over Mg₂SO₄ and concentrated *in vacuo*. Silica gel chromatography (hexanes-EtOAc) affords Methyl 4'-(5-chloro-4-(2-(isopropylsulfonyl)phenylamino)pyridin-2-ylamino)-5'-methoxy-2'-methylbiphenyl-4-carboxylate (**254**); MS m/z 580.2 (M+1).

[0143] Compounds of the present invention may be assessed for their ability to inhibit ALK using assays described below, as well as other assays known in the art.

Ba/F3 cell line panel and reagents

[0144] Ba/F3 is a murine IL-3-dependent pro-B lymphoma cell line. Parental Ba/F3 cells are used to generate a panel of sublines whose proliferation and survival is rendered IL-3-independent by stable transduction with individual tyrosine kinases activated by fusion with the amino-terminal portion of TEL (amino acid 1-375) or BCR. In order to generate Ba/F3 cell lines transformed by Tel-Tyrosine Kinase (TK) fusions, parental Ba/F3 cells are infected with a retrovirus harboring each kinase domain and subjected to puromycin selection and IL-3 withdrawal to obtain IL-3-independent, transformed Ba/F3 cells.

[0145] Each transformed Ba/F3 cells are cultured in RPMI-1640 media (Gibco Cat #11875093, Carlsbad, CA) supplemented with 10% FBS (Hyclone Cat #SV30014.03, Logan,

UT), 4.5 g/L glucose (Sigma #G5400, St.Louis, MO), 1.5 g/L sodium bicarbonate (Biowhittaker #17-613E, Walkersville, MD) and Pen/Strep (Gibco #10378-016, Carlsbad, CA). Cells are splitted twice weekly.

Ba/F3 cell viability inhibition assay

[0146] The potency of test compounds against various Tel-TK transformed Ba/F3 lines is determined as follows. Exponentially growing BaF3 Tel-TK cells are diluted in fresh medium to 75,000 cells/mL and seeded into 384-well plates (3750 cells/well) at 50 μ L/well using a μ Fill liquid dispenser (BioTek, Winooski, VT, USA). Duplicate plates are run for each cell line. Test and control compounds are serially diluted with DMSO and arrayed in a polypropylene 384-well plate. 50 nL of compound is transferred into the assay plates using a pin-transfer device, and the plates are incubated at 37 °C (5% CO₂) for 48 hours. 25 μ L Bright-Glo (Promega, Madison, WI, USA) is added and luminescence is quantified using Analyst GT (Perkin Elmer, Wellesley, MA). Custom curve-fitting software is used to produce a logistic fit of percent cell viability as a function of the logarithm of inhibitor concentration. The IC₅₀ is interpolated as the concentration of compound needed to reduce cell viability to 50% of a DMSO control. Parental Ba/F3 cells that are maintained and cultured in presence of IL-3 (1 ng/ml in final) are diluted in fresh medium containing IL-3 (1 ng/ml in final) to 75,000 cells/mL following the same procedure as described above.

Kapas 299 cellular assay

[0147] Luciferized Karpas 299 (Karpas299-Luc) is generated by infecting retrovirus encoding luciferase gene, and cultured in RPMI-1649 medium supplemented with 10% FBS, 1% P/S/L-Glu. At day 1, cells are harvested and resuspended at density of 150,000 cells/ml (cell number is measured using ViCell (BD)). Cells are dispensed from a diluted suspension into a 384-well assay plate in 50 μ l volume using μ Fill (Bio-TEK). Serially diluted compounds (in DMSO) are transferred into plate using 50 nL pinhead. Assay plates are incubated at 37 °C for 48 hours. At day 4, 25 μ l/well of Bright-Glo reagent (Promega) is added using μ Fill (Bio-TEK). Within 30 minutes, a luciferase signal is measured using Analyst GT in default setting for luminescence detection.

Enzymatic HTRF assay

[0148] ALK enzyme and IGF1R and INSR are purchased from Upstate. Following reagents are prepared in-house; 10 x kinas buffer (KB) (200 mM Tris (pH 7.0), 100 mM MgCl₂, 30 mM MnCl₂, 50 nM NaVO₄), 10 mM ATP, 100 mg/ml BSA, 0.5 M EDTA, 4 M KF. Proxiplate-384 from Perkin-Elmer is used for set up assay. All the HTRF reagents including substrate (Biotin-poly-GT (61GT0BLB), Mab PT66-K, (61T66KLB), Streptavidin-XL^{ent} (611SAXLB)) are purchased from CIS-US, Inc.

[0149] The substrate/ATP mix is prepared by adding ATP (final concentration, 3 μ M) and biotinylated poly-GT (final concentration, 10 ng/ μ l) into 1x KB, and dispensed into Proxiplate-384 at 5 μ l/well using μ Fill (Bio-TEK). Serially diluted compounds (in DMSO) are transferred into plate using 50 nL pinhead. 5 μ L of prepared Enzyme mix (enzyme (final concentration, 5 ng/ μ l), mixed with BSA and DTT in 1x KB) is added to initiate kinase reaction using μ Fill (Bio-TEK). Assay plate is incubated at room temperature for 2 hours. Detection mix is prepared by adding both Mab PT66-K and Streptavidin-XL^{ent} into 0.5 x KB solution containing KF (final concentration, 125 mM), EDTA (final concentration, 50 mM) and BSA (final concentration, 100 μ g/ml) in. At the end of reaction, 10 μ L of detection mix is added and incubated for 30 minutes at room temperature before measurement. HTRF signal is detected using Analyst-GT (molecular dynamic).

Reporter assay in U2OS cells using RE1-pGL3 for IGF1-S3-5 or INSR-S3-5

[0150] Seed 10M cells / T175 Flask in Mc Coy 10% FBS and 4 days later, suck off media and add fresh media. Next day (5 days after seeding), trypsinize cells, wash once with PBS, then resuspend cells in Mc-Coy media 4% delipidated serum with P/S/G. Count cells and dilute to 400,000 cells/ml.

[0151] For 95 ml of cells (400000 cells/ml (40M)), prepare the following DNA/Fugene6 mix: 5 ml Mc-Coy media without serum; 120 μ g DNA mix (20 μ g IGF1R-S3-5 or INSR-S3-5+100 μ g RE1-pGL3); and 240 μ L Fugene6 reagent. Incubate DNA/ Fugene6 mix for 15 min before adding it to cells in 4% delipidated serum. Dispense 50 μ L / well in 384 well plate. 22-24h later, add 50 nL of serially diluted compounds using pinhead. 30 min later, add 2 μ L of 26X IGF1 (or 100X Insulin) dose diluted in Mc-Coy 4% delipidated serum using μ -Fill. 30 hours later, add 25 μ L 100% bright-glo and read on Analyst-GT for measuring luminescence.
