

ABSTRACT

A processing device of an electronic component includes a turning portion, an electronic component holding portion that is provided on the turning portion, a holding position changing portion that enables displacement of the electronic component holding portion with respect to the turning portion in a predetermined displacement direction, a turning drive portion that is configured to turn the turning portion, and a displacement drive portion that is provided so as to move the electronic component holding portion to one side in the displacement direction. The holding position changing portion includes a plurality of parallel leaf springs that intersect the displacement direction and connect the electronic component holding portion and the turning portion.
