

ABSTRACT**WIRELESS SYNCHRONOUS CLOCK SYSTEM**

5 The present system comprises a base station and a plurality of
clocks at various terminals which are synchronized wirelessly by the base
station. At the base station, a reference time signal is extracted from a TV
teletext. The signal is modulated and transmitted wirelessly to the
terminals. The terminals, upon receiving the signal, demodulates the
10 signal and updates the time display. The present system can optionally
include a message board and public address system.
