BACKGROUND OF THE INVENTION

Field of the Invention

[0003] The present invention relates to compounds, processes for their synthesis, compositions and methods for the treatment of hepatitis C virus (HCV) infection.

Description of the Related Art

[0004] Hepatitis C virus (HCV) infection is the most common chronic blood borne infection in the United States. Although the numbers of new infections have declined, the burden of chronic infection is substantial, with Centers for Disease Control estimates of 3.9 million (1.8%) infected persons in the United States. Chronic liver disease is the tenth leading cause of death among adults in the United States, and accounts for approximately 25,000 deaths annually, or approximately 1% of all deaths. Studies indicate that 40% of chronic liver disease is HCV-related, resulting in an estimated 8,000-10,000 deaths each year. HCV-associated end-stage liver disease is the most frequent indication for liver transplantation among adults.

[0005] Antiviral therapy of chronic hepatitis C has evolved rapidly over the last decade, with significant improvements seen in the efficacy of treatment. Nevertheless, even with combination therapy using pegylated IFN-α plus ribavirin, 40% to 50% of patients fail therapy, *i.e.*, are nonresponders (NR) or relapsers. These patients currently have no effective therapeutic alternative. In particular, patients who have advanced fibrosis or cirrhosis on liver

biopsy are at significant risk of developing complications of advanced liver disease, including ascites, jaundice, variceal bleeding, encephalopathy, and progressive liver failure, as well as a markedly increased risk of hepatocellular carcinoma.

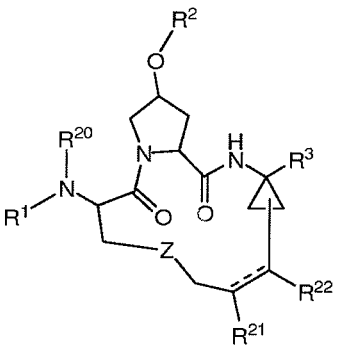

[0006] The high prevalence of chronic HCV infection has important public health implications for the future burden of chronic liver disease in the United States. Data derived from the National Health and Nutrition Examination Survey (NHANES III) indicate that a large increase in the rate of new HCV infections occurred from the late 1960s to the early 1980s, particularly among persons between 20 to 40 years of age. It is estimated that the number of persons with long-standing HCV infection of 20 years or longer could more than quadruple from 1990 to 2015, from 750,000 to over 3 million. The proportional increase in persons infected for 30 or 40 years would be even greater. Since the risk of HCV-related chronic liver disease is related to the duration of infection, with the risk of cirrhosis progressively increasing for persons infected for longer than 20 years, this will result in a substantial increase in cirrhosis-related morbidity and mortality among patients infected between the years of 1965-1985.

[0007] HCV is an enveloped positive strand RNA virus in the Flaviviridae family. The single strand HCV RNA genome is approximately 9500 nucleotides in lingth and has a single open reading frame (ORF) encoding a single large polyprotein of about 3000 amino acids. In infected cells, this polyprotein is cleaved at multiple sites by cellular and viral proteases to produce the structural and non-structural (NS) proteins of the virus. In the case of HCV, the generation of mature nonstructural proteins (NS2, NS3, NS4, NS4A, NS4B, NS5A, and NS5B) is effected by two viral proteases. The first viral protease cleaves at the NS2-NS3 junction of the polyprotein. The second viral protease is serine protease contained within the N-terminal region of NS3 (herein referred to as "NS3 protease"). NS3 protease mediates all of the subsequent cleavage events at sites downstream relative to the position of NS3 in the polyprotein (i.e., sites located between the C-terminus of NS3 and the C-terminus of the polyprotein). NS3 protease exhibits activity both in cis, at the NS3-NS4 cleavage site, and in trans, for the remaining NS4A-NS4B, NS4B-NS5A, and NS5A-NS5B sites. The NS4A protein is believed to serve multiple functions, acting as a cofactor for the NS3 protease and possibly assisting in the membrane localization of NS3 and other viral replicase components. Apparently, the formation of the complex between NS3 and NS4A is necessary for NS3-mediated processing events and enhances proteolytic efficiency at all sites recognized by NS3. The NS3 protease also exhibits nucleoside triphosphatase and RNA

helicase activities. NS5B is an RNA-dependent RNA polymerase involved in the replication of HCV RNA.

[0020] As used herein, the term "hepatic fibrosis," used interchangeably herein with "liver fibrosis," refers to the growth of scar tissue in the liver that can occur in the context of a chronic hepatitis infection.

[0021] The terms "individual," "host," "subject," and "patient" are used interchangeably herein, and refer to a mammal, including, but not limited to, primates, including simians and humans.

[0022] As used herein, the term "liver function" refers to a normal function of the liver, including, but not limited to, a synthetic function, including, but not limited to, synthesis of proteins such as serum proteins (e.g., albumin, clotting factors, alkaline phosphatase, aminotransferases (e.g., alanine transaminase, aspartate transaminase), 5'-nucleosidase, γ-glutaminyltranspeptidase, etc.), synthesis of bilirubin, synthesis of cholesterol, and synthesis of bile acids; a liver metabolic function, including, but not limited to, carbohydrate metabolism, amino acid and ammonia metabolism, hormone metabolism, and lipid metabolism; detoxification of exogenous drugs; a hemodynamic function, including splanchnic and portal hemodynamics; and the like.

[0023] The term "sustained viral response" (SVR; also referred to as a "sustained response" or a "durable response"), as used herein, refers to the response of an individual to a

treatment regimen for HCV infection, in terms of serum HCV titer. Generally, a "sustained viral response" refers to no detectable HCV RNA (e.g., less than about 500, less than about 200, or less than about 100 genome copies per milliliter serum) found in the patient's serum for a period of at least about one month, at least about two months, at least about three months, at least about four months, at least about five months, or at least about six months following cessation of treatment.

[0024] "Treatment failure patients" as used herein generally refers to HCV-infected patients who failed to respond to previous therapy for HCV (referred to as "non-responders") or who initially responded to previous therapy, but in whom the therapeutic response was not maintained (referred to as "relapsers"). The previous therapy generally can include treatment with IFN-α monotherapy or IFN-α combination therapy, where the combination therapy may include administration of IFN-α and an antiviral agent such as ribavirin.

[0025] As used herein, the terms "treatment," "treating," and the like, refer to obtaining a desired pharmacologic and/or physiologic effect. The effect may be prophylactic in terms of completely or partially preventing a disease or symptom thereof and/or may be therapeutic in terms of a partial or complete cure for a disease and/or adverse affect attributable to the disease. "Treatment," as used herein, covers any treatment of a disease in a mammal, particularly in a human, and includes: (a) preventing the disease from occurring in a subject which may be predisposed to the disease but has not yet been diagnosed as having it; (b) inhibiting the disease, i.e., arresting its development; and (c) relieving the disease, i.e., causing regression of the disease.

[0026] The terms "individual," "host," "subject," and "patient" are used interchangeably herein, and refer to a mammal, including, but not limited to, murines, simians, humans, mammalian farm animals, mammalian sport animals, and mammalian pets.

[0027] As used herein, the term "a Type I interferon receptor agonist" refers to any naturally occurring or non-naturally occurring ligand of human Type I interferon receptor, which binds to and causes signal transduction via the receptor. Type I interferon receptor agonists include interferons, including naturally-occurring interferons, modified interferons, synthetic interferons, pegylated interferons, fusion proteins comprising an interferon and a heterologous protein, shuffled interferons; antibody specific for an interferon receptor; non-peptide chemical agonists; and the like.

[0028] As used herein, the term "Type II interferon receptor agonist" refers to any naturally occurring or non-naturally occurring ligand of human Type II interferon receptor that binds to and causes signal transduction via the receptor. [0029] As used herein, the term "a Type III interferon receptor agonist" refers to any naturally occurring or non-naturally occurring ligand of humanIL-28 receptor α ("IL-28R"), the amino acid sequence of which is described by Sheppard, et al., infra., that binds to and causes signal transduction via the receptor.

[0030] As used herein, the term "interferon receptor agonist" refers to any Type I interferon receptor agonist, Type II interferon receptor agonist, or Type III interferon receptor agonist.

[0031] The term "dosing event" as used herein refers to administration of an antiviral agent to a patient in need thereof, which event may encompass one or more releases of an antiviral agent from a drug dispensing device. Thus, the term "dosing event," as used herein, includes, but is not limited to, installation of a continuous delivery device (e.g., a pump or other controlled release injectible system); and a single subcutaneous injection followed by installation of a continuous delivery system.

[0032] "Continuous delivery" as used herein (e.g., in the context of "continuous delivery of a substance to a tissue") is meant to refer to movement of drug to a delivery site, e.g., into a tissue in a fashion that provides for delivery of a desired amount of substance into the tissue over a selected period of time, where about the same quantity of drug is received by the patient each minute during the selected period of time.

[0033] "Controlled release" as used herein (e.g., in the context of "controlled drug release") is meant to encompass release of substance (e.g., a Type I or Type III interferon receptor agonist, e.g., IFN-α) at a selected or otherwise controllable rate, interval, and/or amount, which is not substantially influenced by the environment of use. "Controlled release" thus encompasses, but is not necessarily limited to, substantially continuous delivery, and patterned delivery (e.g., intermittent delivery over a period of time that is interrupted by regular or irregular time intervals).

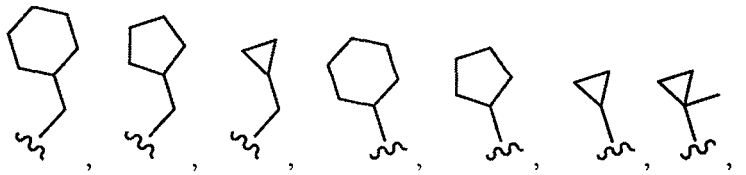

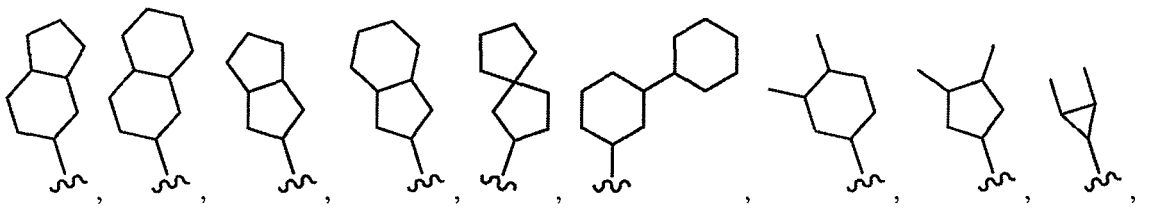

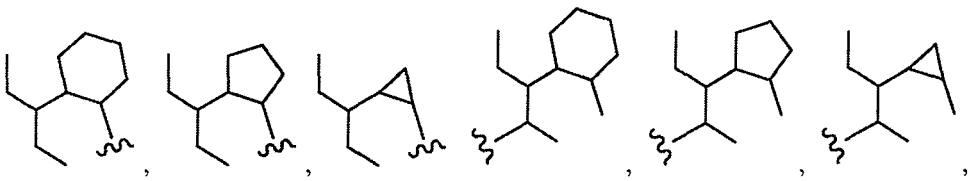

[0034] "Patterned" or "temporal" as used in the context of drug delivery is meant delivery of drug in a pattern, generally a substantially regular pattern, over a pre-selected period of time (e.g., other than a period associated with, for example a bolus injection). "Patterned" or "temporal" drug delivery is meant to encompass delivery of drug at an increasing, decreasing, substantially constant, or pulsatile, rate or range of rates (e.g., amount of drug per unit time, or volume of drug formulation for a unit time), and further encompasses delivery that is continuous or substantially continuous, or chronic.

[0035] The term "controlled drug delivery device" is meant to encompass any device wherein the release (e.g., rate, timing of release) of a drug or other desired substance contained therein is controlled by or determined by the device itself and not substantially influenced by the environment of use, or releasing at a rate that is reproducible within the environment of use.

[0036] By "substantially continuous" as used in, for example, the context of "substantially continuous infusion" or "substantially continuous delivery" is meant to refer to delivery of drug in a manner that is substantially uninterrupted for a pre-selected period of drug delivery, where the quantity of drug received by the patient during any 8 hour interval in the pre-selected period never falls to zero. Furthermore, "substantially continuous" drug delivery can also encompass delivery of drug at a substantially constant, pre-selected rate or range of rates (e.g., amount of drug per unit time, or volume of drug formulation for a unit time) that is substantially uninterrupted for a pre-selected period of drug delivery.

[0037] By "substantially steady state" as used in the context of a biological parameter that may vary as a function of time, it is meant that the biological parameter exhibits a substantially constant value over a time course, such that the area under the curve defined by the value of the biological parameter as a function of time for any 8 hour period during the time course (AUC8hr) is no more than about 20% above or about 20% below, and preferably no more than about 15% above or about 15% below, and more preferably no more than about 10% above or about 10% below, the average area under the curve of the biological parameter over an 8 hour period during the time course (AUC8hr average). The AUC8hr average is defined as the quotient (q) of the area under the curve of the biological parameter over the entirety of the time course (AUCtotal) divided by the number of 8 hour intervals in the time course (total/3days), i.e., q = (AUCtotal)/ (total/3days). For example, in the context of a serum concentration of a drug, the serum concentration of the drug is maintained at a substantially steady state during a time course when the area under the curve of serum

concentration of the drug over time for any 8 hour period during the time course (AUC8hr) is no more than about 20% above or about 20% below the average area under the curve of serum concentration of the drug over an 8 hour period in the time course (AUC8hr average), i.e., the AUC8hr is no more than 20% above or 20% below the AUC8hr average for the serum concentration of the drug over the time course.

[0215] As used herein, an NS3 protease S1' pocket moiety refers to a moiety of the NS3 protease that interacts with the amino acid positioned one residue C-terminal to the cleavage site of the substrate polypeptide cleaved by NS3 protease (e.g., the NS3 protease

moieties that interact with amino acid S in the polypeptide substrate DLEVVT-STWVLV, SEQ ID NO: 1). Exemplary moieties include, but are not limited to, atoms of the peptide backbone or side chains of amino acids Lys136, Gly137, Ser139, His57, Gly58, Gln41, Ser42, and Phe43, see Yao. et. al., Structure 1999, 7, 1353.

[0216] As used herein, an NS3 protease S2 pocket moiety refers to a moiety of the NS3 protease that interacts with the amino acid positioned two residues N-terminal to the cleavage site of the substrate polypeptide cleaved by NS3 protease (e.g., the NS3 protease moieties that interact with amino acid V in the polypeptide substrate DLEVVT-STWVLV, SEQ ID NO: 1). Exemplary moieties include, but are not limited to, atoms of the peptide backbone or side chains of amino acids His57, Arg155, Val78, Asp79, Gln80 and Asp81, see Yao. et. al., Structure 1999, 7, 1353.

[0217] Embodiments described herein include compounds containing moieties having a size, configuration and/or position selected to interact and/or be in proximity to particular regions, particular amino acid residues, and/or particular atoms of NS3 protease, upon binding of the compound to NS3 protease. For example, in an embodiment of the compound of the general formulae (X) and (Xa), **Y** is a moiety having a size and configuration such that, upon binding of the compound to NS3 protease, at least one atom of **Y** is within 4 Å or less of at least one moiety selected from NS3 protease His57 imidazole moiety and NS3 protease Gly137 nitrogen atom. In another embodiment of the compound of the general formulae (X) and (Xa), **Y** is a moiety having a size and configuration such that, upon binding of the compound to NS3 protease, at least one atom of **Y** forms a hydrogen bond with a peptide backbone atom or side chain moiety located in the substrate binding pocket of NS3 protease, including, but not limited to, NS3 protease His57 imidazole moiety and NS3 protease Gly137 nitrogen atom. In some instances, **Y** may be configured to form a hydrogen bond with both the NS3 protease His57 imidazole moiety and the NS3 protease Gly137 nitrogen atom. The moiety -NH-SO_2- is an example of a **Y** moiety.

[0218] In a similar fashion, in an embodiment of the compound of the general formulae (X) and (Xa), the $\mathbf{P_1'}$ moiety, different from **Y**, has a size and configuration such that, upon binding of the compound to NS3 protease, at least one atom of $\mathbf{P_1'}$ is within 6 Å or less of at least one NS3 protease S1' pocket moiety selected from the group consisting of Lys136, Gly137, Ser139, His57, Gly58, Gln41, Ser42, and Phe43. In another embodiment of the compound of the general formulae (X) and (Xa), the $\mathbf{P_1'}$ moiety, different from **Y**, has a size and configuration such that, upon binding of the compound to NS3 protease, at least one

atom of P_1' forms a non-polar interaction with peptide backbone or side chain atom or atoms located in the substrate binding pocket of NS3 protease, including, but not limited to amino acid residues that form the NS3 protease S1' pocket. For example the P_1' moiety may form a non-polar interaction with at least one amino acid selected from Lys136, Gly137, Ser139, His57, Gly58, Gln41, Ser42, and Phe43. The moieties C_{3-7} cycloalkyl, C_{4-10} alkylcycloalkyl and di(C_{1-4} alkyl)amine are examples of P_1' moieties. Examples of **Y**-P_1' include -NH-SO_2-methylcyclopropyl and -NH-SO_2-N(CH_3)$_2$.

[0219] In a similar fashion, in an embodiment of the compound of the general formulae (X) and (Xa), the P_2 moiety has a size and configuration such that, upon binding of the compound to NS3 protease, at least one atom of P_2 is within 5 Å or less of any backbone or side chain atom of at least one NS3 protease residue selected from the group consisting of Tyr56, His57, Val78, Asp79, Gln80, Asp81, Arg155 and Ala156. In an embodiment of the compound of the general formulae (X) and (Xa), P_2 is positioned by **L** to provide this configuration, where **L** is a moiety consisting of from 1 to 5 atoms selected from the group consisting of carbon, oxygen, nitrogen, hydrogen, and sulfur. In an embodiment, **L** is an oxygen atom. In another embodiment, **L** may contain 2 to 5 atoms selected from the group consisting of carbon, oxygen, nitrogen, hydrogen, and sulfur. For example, **L** may contain a moiety having the formula -**W**-C(=**V**)-, where **V** and **W** are each individually selected from O, S or NH. Specific exemplary moieties for **L** include, but are not limited to, ester, amide, carbamate, thioester, and thioamide. In some embodiments, P_2 may be selected from the group consisting of unsubstituted aryl, substituted aryl, unsubstituted heteroaryl, substituted heteroaryl, unsubstituted heterocyclic and substituted heterocyclic.

[0220] In another embodiment of the compound of the general formulae (X) and (Xa), the P_2 moiety has a size and configuration such that, upon binding of the compound to NS3 protease, at least one atom of P_2 forms a non-polar interaction with peptide backbone or side chain atom or atoms located in the substrate binding pocket of NS3 protease, including, but not limited to amino acid residues that form the NS3 protease S2 pocket. For example the P_2 moiety may form a non-polar interaction with at least one amino acid selected from His57, Arg155, Val78, Asp79, Gln80 and Asp81. The P_2 moiety also may be configured to form a hydrogen bond with peptide backbone or side chain atom or atoms located in the substrate binding pocket of NS3 protease, including, but not limited to amino acid residues that form the NS3 protease S2 pocket. For example the P_2 moiety may form a hydrogen bond with at

least one amino acid selected from His57, Arg155, Val78, Asp79, Gln80 and Asp81. In some instances, $\mathbf{P_2}$ may form both a non-polar interaction and a hydrogen bond with peptide backbone or side chain moieties or atoms located in the substrate binding pocket of NS3 protease, such amino acids selected from His57, Arg155, Val78, Asp79, Gln80 and Asp81. Such hydrogen bond and non-polar interactions may occur with the same amino acid residue or with different amino acid residues in the NS3 protease S2 pocket. In an embodiment of the compound of the general formulae (X) and (Xa), $\mathbf{P_2}$ is positioned by **L** to provide this configuration, where **L** is a moiety as described above. In some embodiments, $\mathbf{P_2}$ may be selected from the group consisting of unsubstituted aryl, substituted aryl, unsubstituted heteroaryl, substituted heteroaryl, unsubstituted heterocyclic and substituted heterocyclic.

[0221] In another embodiment of the compound of the general formulae (X) and (Xa), the $\mathbf{R^{50}}$ and $\mathbf{R^{60}}$ moieties have a size, configuration and/or positioning such that, upon binding of the compound to NS3 protease, at least one atom of $\mathbf{R^{50}}$ or $\mathbf{R^{60}}$ is within 5 Å or less of any backbone or side chain atom of at least one NS3 protease residue selected from the group consisting of Arg123, Ala156, Ala157, Val158, Cys159, and Asp168. In an embodiment, $\mathbf{R^{50}}$ is H and $\mathbf{R^{60}}$ is selected from the group consisting of unsubstituted aryl, substituted aryl, unsubstituted heteroaryl, substituted heteroaryl, unsubstituted heterocyclic and substituted heterocyclic; or $\mathbf{R^{50}}$ and $\mathbf{R^{60}}$ taken together with the nitrogen to which they are attached form a moiety selected from the group consisting of unsubstituted heteroaryl, substituted heteroaryl, unsubstituted heterocyclic and substituted heterocyclic.

[0231] In many embodiments, a subject compound inhibits the enzymatic activity of a hepatitis virus C (HCV) NS3 protease. Whether a subject compound inhibits HCV viral replication can be determined using methods known in the art, including an in vitro viral replication assay.

Treating a hepatitis virus infection

[0235] The methods and compositions described herein are generally useful in treatment of an of HCV infection.

[0236] Whether a subject method is effective in treating an HCV infection can be determined by a reduction in viral load, a reduction in time to seroconversion (virus undetectable in patient serum), an increase in the rate of sustained viral response to therapy, a reduction of morbidity or mortality in clinical outcomes, or other indicator of disease response.

[0237] In general, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to reduce viral load or achieve a sustained viral response to therapy.

[0238] Whether a subject method is effective in treating an HCV infection can be determined by measuring viral load, or by measuring a parameter associated with HCV infection, including, but not limited to, liver fibrosis, elevations in serum transaminase levels, and necroinflammatory activity in the liver. Indicators of liver fibrosis are discussed in detail below.

[0239] The method involves administering an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, optionally in combination with an effective amount of one or more additional antiviral agents. In some embodiments, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to reduce viral titers to undetectable levels, e.g., to about 1000 to about 5000, to about 500 to about 1000, or to about 100 to about 500 genome copies/mL serum. In some embodiments, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to reduce viral load to lower than 100 genome copies/mL serum.

[0240] In some embodiments, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to achieve a 1.5-log, a 2-log, a 2.5-log, a 3-log, a 3.5-log, a 4-log, a 4.5-log, or a 5-log reduction in viral titer in the serum of the individual.

[0241] In many embodiments, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to achieve a sustained viral response, e.g., non-detectable or substantially non-detectable HCV RNA (e.g., less than about 500, less than about 400, less than about 200, or less than about 100 genome copies per milliliter serum) is found in the patient's serum for a period of at least about one month, at least about two months, at least about three months, at least about four months, at least about five months, or at least about six months following cessation of therapy.

[0242] As noted above, whether a subject method is effective in treating an HCV infection can be determined by measuring a parameter associated with HCV infection, such as liver fibrosis. Methods of determining the extent of liver fibrosis are discussed in detail below. In some embodiments, the level of a serum marker of liver fibrosis indicates the degree of liver fibrosis.

[0243] As one non-limiting example, levels of serum alanine aminotransferase (ALT) are measured, using standard assays. In general, an ALT level of less than about 45

international units is considered normal. In some embodiments, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount effective to reduce ALT levels to less than about 45 IU/mL serum.

[0244] A therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to reduce a serum level of a marker of liver fibrosis by at least about 10%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, or at least about 80%, or more, compared to the level of the marker in an untreated individual, or to a placebo-treated individual. Methods of measuring serum markers include immunological-based methods, e.g., enzyme-linked immunosorbent assays (ELISA), radioimmunoassays, and the like, using antibody specific for a given serum marker.

[0245] In many embodiments, an effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X and an additional antiviral agent is a synergistic amount. The additional antiviral agent may itself be a combination of antiviral agents, e.g., a combination of pegylated interferon-alfa and ribavirin. As used herein, a "synergistic combination" or a "synergistic amount" of a compound of Formulae I, II, III, IV, V, VI, VII, or X and an additional antiviral agent is a combined dosage that is more effective in the therapeutic or prophylactic treatment of an HCV infection than the incremental improvement in treatment outcome that could be predicted or expected from a merely additive combination of (i) the therapeutic or prophylactic benefit of the compound of Formulae I, II, III, IV, V, VI, VII, or X when administered at that same dosage as a monotherapy and (ii) the therapeutic or prophylactic benefit of the additional antiviral agent when administered at the same dosage as a monotherapy.

[0246] In some embodiments, a selected amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X and a selected amount of an additional antiviral agent are effective when used in combination therapy for a disease, but the selected amount of the compound of Formulae I, II, III, IV, V, VI, VII, or X and/or the selected amount of the additional antiviral agent is ineffective when used in monotherapy for the disease. Thus, the embodiments encompass (1) regimens in which a selected amount of the additional antiviral agent enhances the therapeutic benefit of a selected amount of the compound of Formulae I, II, III, IV, V, VI,

VII, or X when used in combination therapy for a disease, where the selected amount of the additional antiviral agent provides no therapeutic benefit when used in monotherapy for the disease (**2**) regimens in which a selected amount of the compound of Formulae I, II, III, IV, V, VI, VII, or X enhances the therapeutic benefit of a selected amount of the additional antiviral agent when used in combination therapy for a disease, where the selected amount of the compound of Formulae I, II, III, IV, V, VI, VII, or X provides no therapeutic benefit when used in monotherapy for the disease and (**3**) regimens in which a selected amount of the compound of Formulae I, II, III, IV, V, VI, VII, or X and a selected amount of the additional antiviral agent provide a therapeutic benefit when used in combination therapy for a disease, where each of the selected amounts of the compound of Formulae I, II, III, IV, V, VI, VII, or X and the additional antiviral agent, respectively, provides no therapeutic benefit when used in monotherapy for the disease. As used herein, a "synergistically effective amount" of a compound of Formulae I, II, III, IV, V, VI, VII, or X and an additional antiviral agent, and its grammatical equivalents, shall be understood to include any regimen encompassed by any of (**1**)-(**3**) above.

Fibrosis

[0247] The embodiments provides methods for treating liver fibrosis (including forms of liver fibrosis resulting from, or associated with, HCV infection), generally involving administering a therapeutic amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents. Effective amounts of compounds of Formulae I, II, III, IV, V, VI, VII, or X, with and without one or more additional antiviral agents, as well as dosing regimens, are as discussed below.

[0248] Whether treatment with a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is effective in reducing liver fibrosis is determined by any of a number of well-established techniques for measuring liver fibrosis and liver function. Liver fibrosis reduction is determined by analyzing a liver biopsy sample. An analysis of a liver biopsy comprises assessments of two major components: necroinflammation assessed by "grade" as a measure of the severity and ongoing disease activity, and the lesions of fibrosis and parenchymal or vascular remodeling as assessed by "stage" as being reflective of long-term disease progression. See, e.g., Brunt (2000) Hepatol. 31:241-246; and METAVIR (1994) Hepatology 20:15-20. Based on analysis of the liver biopsy, a score is assigned. A number of standardized scoring systems exist which provide a

quantitative assessment of the degree and severity of fibrosis. These include the METAVIR, Knodell, Scheuer, Ludwig, and Ishak scoring systems.

[0249] The METAVIR scoring system is based on an analysis of various features of a liver biopsy, including fibrosis (portal fibrosis, centrilobular fibrosis, and cirrhosis); necrosis (piecemeal and lobular necrosis, acidophilic retraction, and ballooning degeneration); inflammation (portal tract inflammation, portal lymphoid aggregates, and distribution of portal inflammation); bile duct changes; and the Knodell index (scores of periportal necrosis, lobular necrosis, portal inflammation, fibrosis, and overall disease activity). The definitions of each stage in the METAVIR system are as follows: score: 0, no fibrosis; score: 1, stellate enlargement of portal tract but without septa formation; score: 2, enlargement of portal tract with rare septa formation; score: 3, numerous septa without cirrhosis; and score: 4, cirrhosis.

[0250] Knodell's scoring system, also called the Hepatitis Activity Index, classifies specimens based on scores in four categories of histologic features: I. Periportal and/or bridging necrosis; II. Intralobular degeneration and focal necrosis; III. Portal inflammation; and IV. Fibrosis. In the Knodell staging system, scores are as follows: score: 0, no fibrosis; score: 1, mild fibrosis (fibrous portal expansion); score: 2, moderate fibrosis; score: 3, severe fibrosis (bridging fibrosis); and score: 4, cirrhosis. The higher the score, the more severe the liver tissue damage. Knodell (1981) Hepatol. 1:431.

[0251] In the Scheuer scoring system scores are as follows: score: 0, no fibrosis; score: 1, enlarged, fibrotic portal tracts; score: 2, periportal or portal-portal septa, but intact architecture; score: 3, fibrosis with architectural distortion, but no obvious cirrhosis; score: 4, probable or definite cirrhosis. Scheuer (1991) J. Hepatol. 13:372.

[0252] The Ishak scoring system is described in Ishak (1995) J. Hepatol. 22:696-699. Stage 0, No fibrosis; Stage 1, Fibrous expansion of some portal areas, with or without short fibrous septa; stage 2, Fibrous expansion of most portal areas, with or without short fibrous septa; stage 3, Fibrous expansion of most portal areas with occasional portal to portal (P-P) bridging; stage 4, Fibrous expansion of portal areas with marked bridging (P-P) as well as portal-central (P-C); stage 5, Marked bridging (P-P and/or P-C) with occasional nodules (incomplete cirrhosis); stage 6, Cirrhosis, probable or definite.

[0253] The benefit of anti-fibrotic therapy can also be measured and assessed by using the Child-Pugh scoring system which comprises a multicomponent point system based upon abnormalities in serum bilirubin level, serum albumin level, prothrombin time, the

presence and severity of ascites, and the presence and severity of encephalopathy. Based upon the presence and severity of abnormality of these parameters, patients may be placed in one of three categories of increasing severity of clinical disease: A, B, or C.

[0254] In some embodiments, a therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that effects a change of one unit or more in the fibrosis stage based on pre- and post-therapy liver biopsies. In particular embodiments, a therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, reduces liver fibrosis by at least one unit in the METAVIR, the Knodell, the Scheuer, the Ludwig, or the Ishak scoring system.

[0255] Secondary, or indirect, indices of liver function can also be used to evaluate the efficacy of treatment with a compound of Formulae I, II, III, IV, V, VI, VII, or X. Morphometric computerized semi- automated assessment of the quantitative degree of liver fibrosis based upon specific staining of collagen and/or serum markers of liver fibrosis can also be measured as an indication of the efficacy of a subject treatment method. Secondary indices of liver function include, but are not limited to, serum transaminase levels, prothrombin time, bilirubin, platelet count, portal pressure, albumin level, and assessment of the Child-Pugh score.

[0256] An effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to increase an index of liver function by at least about 10%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, or at least about 80%, or more, compared to the index of liver function in an untreated individual, or to a placebo-treated individual. Those skilled in the art can readily measure such indices of liver function, using standard assay methods, many of which are commercially available, and are used routinely in clinical settings.

[0257] Serum markers of liver fibrosis can also be measured as an indication of the efficacy of a subject treatment method. Serum markers of liver fibrosis include, but are not limited to, hyaluronate, N-terminal procollagen III peptide, 7S domain of type IV collagen, C-terminal procollagen I peptide, and laminin. Additional biochemical markers of liver fibrosis include α-2-macroglobulin, haptoglobin, gamma globulin, apolipoprotein A, and gamma glutamyl transpeptidase.

[0258] A therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective to reduce a serum level of a marker of liver fibrosis by at least about 10%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, or at least about 80%, or more, compared to the level of the marker in an untreated individual, or to a placebo-treated individual. Those skilled in the art can readily measure such serum markers of liver fibrosis, using standard assay methods, many of which are commercially available, and are used routinely in clinical settings. Methods of measuring serum markers include immunological-based methods, e.g., enzyme-linked immunosorbent assays (ELISA), radioimmunoassays, and the like, using antibody specific for a given serum marker.

[0259] Quantitative tests of functional liver reserve can also be used to assess the efficacy of treatment with an interferon receptor agonist and pirfenidone (or a pirfenidone analog). These include: indocyanine green clearance (ICG), galactose elimination capacity (GEC), aminopyrine breath test (ABT), antipyrine clearance, monoethylglycine-xylidide (MEG-X) clearance, and caffeine clearance.

[0260] As used herein, a "complication associated with cirrhosis of the liver" refers to a disorder that is a sequellae of decompensated liver disease, i.e., or occurs subsequently to and as a result of development of liver fibrosis, and includes, but it not limited to, development of ascites, variceal bleeding, portal hypertension, jaundice, progressive liver insufficiency, encephalopathy, hepatocellular carcinoma, liver failure requiring liver transplantation, and liver-related mortality.

[0261] A therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount that is effective in reducing the incidence (e.g., the likelihood that an individual will develop) of a disorder associated with cirrhosis of the liver by at least about 10%, at least about 20%, at least about 25%, at least about 30%, at least about 35%, at least about 40%, at least about 45%, at least about 50%, at least about 55%, at least about 60%, at least about 65%, at least about 70%, at least about 75%, or at least about 80%, or more, compared to an untreated individual, or to a placebo-treated individual.

[0262] Whether treatment with a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is effective in reducing the

incidence of a disorder associated with cirrhosis of the liver can readily be determined by those skilled in the art.

[0263] Reduction in liver fibrosis increases liver function. Thus, the embodiments provide methods for increasing liver function, generally involving administering a therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents. Liver functions include, but are not limited to, synthesis of proteins such as serum proteins (e.g., albumin, clotting factors, alkaline phosphatase, aminotransferases (e.g., alanine transaminase, aspartate transaminase), 5'-nucleosidase, γ-glutaminyltranspeptidase, etc.), synthesis of bilirubin, synthesis of cholesterol, and synthesis of bile acids; a liver metabolic function, including, but not limited to, carbohydrate metabolism, amino acid and ammonia metabolism, hormone metabolism, and lipid metabolism; detoxification of exogenous drugs; a hemodynamic function, including splanchnic and portal hemodynamics; and the like.

[0264] Whether a liver function is increased is readily ascertainable by those skilled in the art, using well-established tests of liver function. Thus, synthesis of markers of liver function such as albumin, alkaline phosphatase, alanine transaminase, aspartate transaminase, bilirubin, and the like, can be assessed by measuring the level of these markers in the serum, using standard immunological and enzymatic assays. Splanchnic circulation and portal hemodynamics can be measured by portal wedge pressure and/or resistance using standard methods. Metabolic functions can be measured by measuring the level of ammonia in the serum.

[0265] Whether serum proteins normally secreted by the liver are in the normal range can be determined by measuring the levels of such proteins, using standard immunological and enzymatic assays. Those skilled in the art know the normal ranges for such serum proteins. The following are non-limiting examples. The normal level of alanine transaminase is about 45 IU per milliliter of serum. The normal range of aspartate transaminase is from about 5 to about 40 units per liter of serum. Bilirubin is measured using standard assays. Normal bilirubin levels are usually less than about 1.2 mg/dL. Serum albumin levels are measured using standard assays. Normal levels of serum albumin are in the range of from about 35 to about 55 g/L. Prolongation of prothrombin time is measured using standard assays. Normal prothrombin time is less than about 4 seconds longer than control.

[0266] A therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is one that is effective to increase liver function by at least about 10%, at least about 20%, at least about 30%, at least about 40%, at least about 50%, at least about 60%, at least about 70%, at least about 80%, or more. For example, a therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is an amount effective to reduce an elevated level of a serum marker of liver function by at least about 10%, at least about 20%, at least about 30%, at least about 40%, at least about 50%, at least about 60%, at least about 70%, at least about 80%, or more, or to reduce the level of the serum marker of liver function to within a normal range. A therapeutically effective amount of a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents, is also an amount effective to increase a reduced level of a serum marker of liver function by at least about 10%, at least about 20%, at least about 30%, at least about 40%, at least about 50%, at least about 60%, at least about 70%, at least about 80%, or more, or to increase the level of the serum marker of liver function to within a normal range.

Dosages, Formulations, and Routes of Administration

[0267] In the subject methods, the active agent(s) (*e.g.*, compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agents) may be administered to the host using any convenient means capable of resulting in the desired therapeutic effect. Thus, the agent can be incorporated into a variety of formulations for therapeutic administration. More particularly, the agents of the embodiments can be formulated into pharmaceutical compositions by combination with appropriate, pharmaceutically acceptable carriers or diluents, and may be formulated into preparations in solid, semi-solid, liquid or gaseous forms, such as tablets, capsules, powders, granules, ointments, solutions, suppositories, injections, inhalants and aerosols.

Formulations

[0268] The above-discussed active agent(s) can be formulated using well-known reagents and methods. Compositions are provided in formulation with a pharmaceutically acceptable excipient(s). A wide variety of pharmaceutically acceptable excipients is known in the art and need not be discussed in detail herein. Pharmaceutically acceptable excipients have been amply described in a variety of publications, including, for example, A. Gennaro

(2000) "Remington: The Science and Practice of Pharmacy," 20th edition, Lippincott, Williams, & Wilkins; Pharmaceutical Dosage Forms and Drug Delivery Systems (1999) H.C. Ansel et al., eds., 7th ed., Lippincott, Williams, & Wilkins; and Handbook of Pharmaceutical Excipients (2000) A.H. Kibbe et al., eds., 3rd ed. Amer. Pharmaceutical Assoc.

[0269] The pharmaceutically acceptable excipients, such as vehicles, adjuvants, carriers or diluents, are readily available to the public. Moreover, pharmaceutically acceptable auxiliary substances, such as pH adjusting and buffering agents, tonicity adjusting agents, stabilizers, wetting agents and the like, are readily available to the public.

[0270] In some embodiments, an agent is formulated in an aqueous buffer. Suitable aqueous buffers include, but are not limited to, acetate, succinate, citrate, and phosphate buffers varying in strengths from about 5 mM to about 100 mM. In some embodiments, the aqueous buffer includes reagents that provide for an isotonic solution. Such reagents include, but are not limited to, sodium chloride; and sugars *e.g.*, mannitol, dextrose, sucrose, and the like. In some embodiments, the aqueous buffer further includes a non-ionic surfactant such as polysorbate 20 or 80. Optionally the formulations may further include a preservative. Suitable preservatives include, but are not limited to, a benzyl alcohol, phenol, chlorobutanol, benzalkonium chloride, and the like. In many cases, the formulation is stored at about 4°C. Formulations may also be lyophilized, in which case they generally include cryoprotectants such as sucrose, trehalose, lactose, maltose, mannitol, and the like. Lyophilized formulations can be stored over extended periods of time, even at ambient temperatures.

[0271] As such, administration of the agents can be achieved in various ways, including oral, buccal, rectal, parenteral, intraperitoneal, intradermal, subcutaneous, intramuscular, transdermal, intratracheal, etc., administration. In many embodiments, administration is by bolus injection, *e.g.*, subcutaneous bolus injection, intramuscular bolus injection, and the like.

[0272] The pharmaceutical compositions of the embodiments can be administered orally, parenterally or via an implanted reservoir. Oral administration or administration by injection is preferred.

[0273] Subcutaneous administration of a pharmaceutical composition of the embodiments is accomplished using standard methods and devices, e.g., needle and syringe, a subcutaneous injection port delivery system, and the like. See, *e.g.*, U.S. Patent Nos. 3,547,119; 4,755,173; 4,531,937; 4,311,137; and 6,017,328. A combination of a

subcutaneous injection port and a device for administration of a pharmaceutical composition of the embodiments to a patient through the port is referred to herein as "a subcutaneous injection port delivery system." In many embodiments, subcutaneous administration is achieved by bolus delivery by needle and syringe.

[0274] In pharmaceutical dosage forms, the agents may be administered in the form of their pharmaceutically acceptable salts, or they may also be used alone or in appropriate association, as well as in combination, with other pharmaceutically active compounds. The following methods and excipients are merely exemplary and are in no way limiting.

[0275] For oral preparations, the agents can be used alone or in combination with appropriate additives to make tablets, powders, granules or capsules, for example, with conventional additives, such as lactose, mannitol, corn starch or potato starch; with binders, such as crystalline cellulose, cellulose derivatives, acacia, corn starch or gelatins; with disintegrators, such as corn starch, potato starch or sodium carboxymethylcellulose; with lubricants, such as talc or magnesium stearate; and if desired, with diluents, buffering agents, moistening agents, preservatives and flavoring agents.

[0276] The agents can be formulated into preparations for injection by dissolving, suspending or emulsifying them in an aqueous or nonaqueous solvent, such as vegetable or other similar oils, synthetic aliphatic acid glycerides, esters of higher aliphatic acids or propylene glycol; and if desired, with conventional additives such as solubilizers, isotonic agents, suspending agents, emulsifying agents, stabilizers and preservatives.

[0277] Furthermore, the agents can be made into suppositories by mixing with a variety of bases such as emulsifying bases or water-soluble bases. The compounds of the embodiments can be administered rectally via a suppository. The suppository can include vehicles such as cocoa butter, carbowaxes and polyethylene glycols, which melt at body temperature, yet are solidified at room temperature.

[0278] Unit dosage forms for oral or rectal administration such as syrups, elixirs, and suspensions may be provided wherein each dosage unit, for example, teaspoonful, tablespoonful, tablet or suppository, contains a predetermined amount of the composition containing one or more inhibitors. Similarly, unit dosage forms for injection or intravenous administration may comprise the inhibitor(s) in a composition as a solution in sterile water, normal saline or another pharmaceutically acceptable carrier.

[0279] The term "unit dosage form," as used herein, refers to physically discrete units suitable as unitary dosages for human and animal subjects, each unit containing a predetermined quantity of compounds of the embodiments calculated in an amount sufficient to produce the desired effect in association with a pharmaceutically acceptable diluent, carrier or vehicle. The specifications for the novel unit dosage forms of the embodiments depend on the particular compound employed and the effect to be achieved, and the pharmacodynamics associated with each compound in the host.

[0280] The pharmaceutically acceptable excipients, such as vehicles, adjuvants, carriers or diluents, are readily available to the public. Moreover, pharmaceutically acceptable auxiliary substances, such as pH adjusting and buffering agents, tonicity adjusting agents, stabilizers, wetting agents and the like, are readily available to the public.

Other antiviral or antifibrotic agents

[0281] As discussed above, a subject method will in some embodiments be carried out by administering an NS3 inhibitor that is a compound of Formulae I, II, III, IV, V, VI, VII, or X, and optionally one or more additional antiviral agent(s).

[0282] In some embodiments, the method further includes administration of one or more interferon receptor agonist(s). Interferon receptor agonists are described herein.

[0283] In other embodiments, the method further includes administration of pirfenidone or a pirfenidone analog. Pirfenidone and pirfenidone analogs are described herein.

[0284] Additional antiviral agents that are suitable for use in combination therapy include, but are not limited to, nucleotide and nucleoside analogs. Non-limiting examples include azidothymidine (AZT) (zidovudine), and analogs and derivatives thereof; 2',3'-dideoxyinosine (DDI) (didanosine), and analogs and derivatives thereof; 2',3'-dideoxycytidine (DDC) (dideoxycytidine), and analogs and derivatives thereof; 2'3,'-didehydro-2',3'-dideoxythymidine (D4T) (stavudine), and analogs and derivatives thereof; combivir; abacavir; adefovir dipoxil; cidofovir; ribavirin; ribavirin analogs; and the like.

[0285] In some embodiments, the method further includes administration of ribavirin. Ribavirin, 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide, available from ICN Pharmaceuticals, Inc., Costa Mesa, Calif., is described in the Merck Index, compound No. 8199, Eleventh Edition. Its manufacture and formulation is described in U.S. Pat. No. 4,211,771. Some embodiments also involve use of derivatives of ribavirin (see, *e.g.*, U.S.

Pat. No. 6,277,830). The ribavirin may be administered orally in capsule or tablet form, or in the same or different administration form and in the same or different route as the NS-3 inhibitor compound. Of course, other types of administration of both medicaments, as they become available are contemplated, such as by nasal spray, transdermally, intravenously, by suppository, by sustained release dosage form, etc. Any form of administration will work so long as the proper dosages are delivered without destroying the active ingredient.

[0286] In some embodiments, the method further includes administration of ritonavir. Ritonavir, 10-hydroxy-2-methyl-5-(1-methylethyl)-1-[2-(1-methylethyl)-4-thiazolyl]-3,6-dioxo-8,11-bis(phenylmethyl)-2,4,7,12-tetraazatridecan-13-oic acid, 5-thiazolylmethyl ester [5*S*-(5*R**,8*R**,10*R**,11*R**)], available from Abbott Laboratories, is an inhibitor of the protease of the human immunodeficiency virus and also of the cytochrome P450 3A and P450 2D6 liver enzymes frequently involved in hepatic metabolism of therapeutic molecules in man. Because of its strong inhibitory effect on cytochrome P450 3A and the inhibitory effect on cytochrome P450 2D6, ritonavir at doses below the normal therapeutic dosage may be combined with other protease inhibitors to achieve therapeutic levels of the second protease inhibitor while reducing the number of dosage units required, the dosing frequency, or both.

[0287] Coadministration of low-dose ritonavir may also be used to compensate for drug interactions that tend to decrease levels of a protease inhibitor metabolized by CYP3A. Its structure, synthesis, manufacture and formulation are described in U.S. Pat. No. 5,541,206 U.S. Pat. No. 5,635,523 U.S. Pat. No. 5,648,497 U.S. Pat. No. 5,846,987 and U.S. Pat. No. 6,232,333. The ritonavir may be administered orally in capsule or tablet or oral solution form, or in the same or different administration form and in the same or different route as the NS-3 inhibitor compound. Of course, other types of administration of both medicaments, as they become available are contemplated, such as by nasal spray, transdermally, intravenously, by suppository, by sustained release dosage form, etc. Any form of administration will work so long as the proper dosages are delivered without destroying the active ingredient.

[0288] In some embodiments, an additional antiviral agent is administered during the entire course of NS3 inhibitor compound treatment. In other embodiments, an additional antiviral agent is administered for a period of time that is overlapping with that of the NS3 inhibitor compound treatment, e.g., the additional antiviral agent treatment can begin before the NS3 inhibitor compound treatment begins and end before the NS3 inhibitor compound treatment ends; the additional antiviral agent treatment can begin after the NS3 inhibitor

compound treatment begins and end after the NS3 inhibitor compound treatment ends; the additional antiviral agent treatment can begin after the NS3 inhibitor compound treatment begins and end before the NS3 inhibitor compound treatment ends; or the additional antiviral agent treatment can begin before the NS3 inhibitor compound treatment begins and end after the NS3 inhibitor compound treatment ends.

Methods of Treatment

Monotherapies

[0289] The NS3 inhibitor compounds described herein may be used in acute or chronic therapy for HCV disease. In many embodiments, the NS3 inhibitor compound is administered for a period of about 1 day to about 7 days, or about 1 week to about 2 weeks, or about 2 weeks to about 3 weeks, or about 3 weeks to about 4 weeks, or about 1 month to about 2 months, or about 3 months to about 4 months, or about 4 months to about 6 months, or about 6 months to about 8 months, or about 8 months to about 12 months, or at least one year, and may be administered over longer periods of time. The NS3 inhibitor compound can be administered 5 times per day, 4 times per day, tid, bid, qd, qod, biw, tiw, qw, qow, three times per month, or once monthly. In other embodiments, the NS3 inhibitor compound is administered as a continuous infusion.

[0290] In many embodiments, an NS3 inhibitor compound of the embodiments is administered orally.

[0291] In connection with the above-described methods for the treatment of HCV disease in a patient, an NS3 inhibitor compound as described herein may be administered to the patient at a dosage from about 0.01 mg to about 100 mg/kg patient bodyweight per day, in 1 to 5 divided doses per day. In some embodiments, the NS3 inhibitor compound is administered at a dosage of about 0.5 mg to about 75 mg/kg patient bodyweight per day, in 1 to 5 divided doses per day.

[0292] The amount of active ingredient that may be combined with carrier materials to produce a dosage form can vary depending on the host to be treated and the particular mode of administration. A typical pharmaceutical preparation can contain from about 5% to about 95% active ingredient (w/w). In other embodiments, the pharmaceutical preparation can contain from about 20% to about 80% active ingredient.

[0293] Those of skill will readily appreciate that dose levels can vary as a function of the specific NS3 inhibitor compound, the severity of the symptoms and the susceptibility

of the subject to side effects. Preferred dosages for a given NS3 inhibitor compound are readily determinable by those of skill in the art by a variety of means. A preferred means is to measure the physiological potency of a given interferon receptor agonist.

[0294] In many embodiments, multiple doses of NS3 inhibitor compound are administered. For example, an NS3 inhibitor compound is administered once per month, twice per month, three times per month, every other week (qow), once per week (qw), twice per week (biw), three times per week (tiw), four times per week, five times per week, six times per week, every other day (qod), daily (qd), twice a day (qid), or three times a day (tid), over a period of time ranging from about one day to about one week, from about two weeks to about four weeks, from about one month to about two months, from about two months to about four months, from about four months to about six months, from about six months to about eight months, from about eight months to about 1 year, from about 1 year to about 2 years, or from about 2 years to about 4 years, or more.

Combination therapies with ribavirin

[0295] In some embodiments, the methods provide for combination therapy comprising administering an NS3 inhibitor compound as described above, and an effective amount of ribavirin. Ribavirin can be administered in dosages of about 400 mg, about 800 mg, about 1000 mg, or about 1200 mg per day.

[0296] One embodiment provides any of the above-described methods modified to include co-administering to the patient a therapeutically effective amount of ribavirin for the duration of the desired course of NS3 inhibitor compound treatment.

[0297] Another embodiment provides any of the above-described methods modified to include co-administering to the patient about 800 mg to about 1200 mg ribavirin orally per day for the duration of the desired course of NS3 inhibitor compound treatment. In another embodiment, any of the above-described methods may be modified to include co-administering to the patient (a) 1000 mg ribavirin orally per day if the patient has a body weight less than 75 kg or (b) 1200 mg ribavirin orally per day if the patient has a body weight greater than or equal to 75 kg, where the daily dosage of ribavirin is optionally divided into to 2 doses for the duration of the desired course of NS3 inhibitor compound treatment.

Combination therapies with levovirin

[0298] In some embodiments, the methods provide for combination therapy comprising administering an NS3 inhibitor compound as described above, and an effective amount of levovirin. Levovirin is generally administered in an amount ranging from about 30

[0308] Those of skill will readily appreciate that dose levels can vary as a function of the specific α-glucosidase inhibitor, the severity of the symptoms and the susceptibility of the subject to side effects. Preferred dosages for a given α-glucosidase inhibitor are readily determinable by those of skill in the art by a variety of means. A typical means is to measure the physiological potency of a given active agent.

Combination therapies with interferon(s)

[0312] In many embodiments, the methods provide for combination therapy comprising administering an NS3 inhibitor compound as described above, and an effective amount of an interferon receptor agonist. In some embodiments, a compound of Formulae I, II, III, IV, V, VI, VII, or X and a Type I or III interferon receptor agonist are co-administered in the treatment methods described herein. Type I interferon receptor agonists suitable for use herein include any interferon-α (IFN-α). In certain embodiments, the interferon-α is a PEGylated interferon-α. In certain other embodiments, the interferon-α is a consensus

interferon, such as INFERGEN® interferon alfacon-1. In still other embodiments, the interferon-α is a monoPEG (30 kD, linear)-ylated consensus interferon.

[0313] Effective dosages of an IFN-α range from about 3 μg to about 27 μg, from about 3 MU to about 10 MU, from about 90 μg to about 180 μg, or from about 18 μg to about 90 μg. Effective dosages of Infergen® consensus IFN-α include about 3 μg, about 6 μg, about 9 μg, about 12 μg, about 15 μg, about 18 μg, about 21 μg, about 24 μg, about 27 μg, or about 30 μg, of drug per dose. Effective dosages of IFN-α2a and IFN-α2b range from 3 million Units (MU) to 10 MU per dose. Effective dosages of PEGASYS®PEGylated IFN-α2a contain an amount of about 90 μg to 270 μg, or about 180 μg, of drug per dose. Effective dosages of PEG-INTRON®PEGylated IFN-α2b contain an amount of about 0.5 μg to 3.0 μg of drug per kg of body weight per dose. Effective dosages of PEGylated consensus interferon (PEG-CIFN) contain an amount of about 18 μg to about 90 μg, or from about 27 μg to about 60 μg, or about 45 μg, of CIFN amino acid weight per dose of PEG-CIFN. Effective dosages of monoPEG (30 kD, linear)-ylated CIFN contain an amount of about 45 μg to about 270 μg, or about 60 μg to about 180 μg, or about 90 μg to about 120 μg, of drug per dose. IFN-α can be administered daily, every other day, once a week, three times a week, every other week, three times per month, once monthly, substantially continuously or continuously.

[0314] In many embodiments, the Type I or Type III interferon receptor agonist and/or the Type II interferon receptor agonist is administered for a period of about 1 day to about 7 days, or about 1 week to about 2 weeks, or about 2 weeks to about 3 weeks, or about 3 weeks to about 4 weeks, or about 1 month to about 2 months, or about 3 months to about 4 months, or about 4 months to about 6 months, or about 6 months to about 8 months, or about 8 months to about 12 months, or at least one year, and may be administered over longer periods of time. Dosage regimens can include tid, bid, qd, qod, biw, tiw, qw, qow, three times per month, or monthly administrations. Some embodiments provide any of the above-described methods in which the desired dosage of IFN-α is administered subcutaneously to the patient by bolus delivery qd, qod, tiw, biw, qw, qow, three times per month, or monthly, or is administered subcutaneously to the patient per day by substantially continuous or continuous delivery, for the desired treatment duration. In other embodiments, any of the above-described methods may be practiced in which the desired dosage of PEGylated IFN-α (PEG-IFN-α) is administered subcutaneously to the patient by bolus delivery qw, qow, three times per month, or monthly for the desired treatment duration.

[0315] In other embodiments, an NS3 inhibitor compound and a Type II interferon receptor agonist are co-administered in the treatment methods of the embodiments. Type II interferon receptor agonists suitable for use herein include any interferon-γ (IFN-γ).

[0316] Effective dosages of IFN-γ can range from about 0.5 μg/m^2 to about 500 μg/m^2, usually from about 1.5 μg/m^2 to 200 μg/m^2, depending on the size of the patient. This activity is based on 10^6 international units (U) per 50 μg of protein. IFN-γ can be administered daily, every other day, three times a week, or substantially continuously or continuously.

[0317] In specific embodiments of interest, IFN-γ is administered to an individual in a unit dosage form of from about 25 μg to about 500 μg, from about 50 μg to about 400 μg, or from about 100 μg to about 300 μg. In particular embodiments of interest, the dose is about 200 μg IFN-γ. In many embodiments of interest, IFN-γ1b is administered.

[0318] Where the dosage is 200 μg IFN-γ per dose, the amount of IFN-γ per body weight (assuming a range of body weights of from about 45 kg to about 135 kg) is in the range of from about 4.4 μg IFN-γ per kg body weight to about 1.48 μg IFN-γ per kg body weight.

[0319] The body surface area of subject individuals generally ranges from about 1.33 m^2 to about 2.50 m^2. Thus, in many embodiments, an IFN-γ dosage ranges from about 150 μg/m^2 to about 20 μg/m^2. For example, an IFN-γ dosage ranges from about 20 μg/m^2 to about 30 μg/m^2, from about 30 μg/m^2 to about 40 μg/m^2, from about 40 μg/m^2 to about 50 μg/m^2, from about 50 μg/m^2 to about 60 μg/m^2, from about 60 μg/m^2 to about 70 μg/m^2, from about 70 μg/m^2 to about 80 μg/m^2, from about 80 μg/m^2 to about 90 μg/m^2, from about 90 μg/m^2 to about 100 μg/m^2, from about 100 μg/m^2 to about 110 μg/m^2, from about 110 μg/m^2 to about 120 μg/m^2, from about 120 μg/m^2 to about 130 μg/m^2, from about 130 μg/m^2 to about 140 μg/m^2, or from about 140 μg/m^2 to about 150 μg/m^2. In some embodiments, the dosage groups range from about 25 μg/m^2 to about 100 μg/m^2. In other embodiments, the dosage groups range from about 25 μg/m^2 to about 50 μg/m^2.

[0320] In some embodiments, a Type I or a Type III interferon receptor agonist is administered in a first dosing regimen, followed by a second dosing regimen. The first dosing regimen of Type I or a Type III interferon receptor agonist (also referred to as "the induction regimen") generally involves administration of a higher dosage of the Type I or Type III interferon receptor agonist. For example, in the case of Infergen® consensus IFN-α

(CIFN), the first dosing regimen comprises administering CIFN at about 9 μg, about 15 μg, about 18 μg, or about 27 μg. The first dosing regimen can encompass a single dosing event, or at least two or more dosing events. The first dosing regimen of the Type I or Type III interferon receptor agonist can be administered daily, every other day, three times a week, every other week, three times per month, once monthly, substantially continuously or continuously.

[0321] The first dosing regimen of the Type I or Type III interferon receptor agonist is administered for a first period of time, which time period can be at least about 4 weeks, at least about 8 weeks, or at least about 12 weeks.

[0322] The second dosing regimen of the Type I or Type III interferon receptor agonist (also referred to as "the maintenance dose") generally involves administration of a lower amount of the Type I or Type III interferon receptor agonist. For example, in the case of CIFN, the second dosing regimen comprises administering CIFN at a dose of at least about 3 μg, at least about 9 μg, at least about 15 μg, or at least about 18 μg. The second dosing regimen can encompass a single dosing event, or at least two or more dosing events.

[0323] The second dosing regimen of the Type I or Type III interferon receptor agonist can be administered daily, every other day, three times a week, every other week, three times per month, once monthly, substantially continuously or continuously.

[0324] In some embodiments, where an "induction"/"maintenance" dosing regimen of a Type I or a Type III interferon receptor agonist is administered, a "priming" dose of a Type II interferon receptor agonist (e.g., IFN-γ) is included. In these embodiments, IFN-γ is administered for a period of time from about 1 day to about 14 days, from about 2 days to about 10 days, or from about 3 days to about 7 days, before the beginning of treatment with the Type I or Type III interferon receptor agonist. This period of time is referred to as the "priming" phase.

[0325] In some of these embodiments, the Type II interferon receptor agonist treatment is continued throughout the entire period of treatment with the Type I or Type III interferon receptor agonist. In other embodiments, the Type II interferon receptor agonist treatment is discontinued before the end of treatment with the Type I or Type III interferon receptor agonist. In these embodiments, the total time of treatment with Type II interferon receptor agonist (including the "priming" phase) is from about 2 days to about 30 days, from about 4 days to about 25 days, from about 8 days to about 20 days, from about 10 days to

about 18 days, or from about 12 days to about 16 days. In still other embodiments, the Type II interferon receptor agonist treatment is discontinued once Type I or a Type III interferon receptor agonist treatment begins.

[0326] In other embodiments, the Type I or Type III interferon receptor agonist is administered in single dosing regimen. For example, in the case of CIFN, the dose of CIFN is generally in a range of from about 3 μg to about 15 μg, or from about 9 μg to about 15 μg. The dose of Type I or a Type III interferon receptor agonist is generally administered daily, every other day, three times a week, every other week, three times per month, once monthly, or substantially continuously. The dose of the Type I or Type III interferon receptor agonist is administered for a period of time, which period can be, for example, from at least about 24 weeks to at least about 48 weeks, or longer.

[0327] In some embodiments, where a single dosing regimen of a Type I or a Type III interferon receptor agonist is administered, a "priming" dose of a Type II interferon receptor agonist (e.g., IFN-γ) is included. In these embodiments, IFN-γ is administered for a period of time from about 1 day to about 14 days, from about 2 days to about 10 days, or from about 3 days to about 7 days, before the beginning of treatment with the Type I or Type III interferon receptor agonist. This period of time is referred to as the "priming" phase. In some of these embodiments, the Type II interferon receptor agonist treatment is continued throughout the entire period of treatment with the Type I or Type III interferon receptor agonist. In other embodiments, the Type II interferon receptor agonist treatment is discontinued before the end of treatment with the Type I or Type III interferon receptor agonist. In these embodiments, the total time of treatment with the Type II interferon receptor agonist (including the "priming" phase) is from about 2 days to about 30 days, from about 4 days to about 25 days, from about 8 days to about 20 days, from about 10 days to about 18 days, or from about 12 days to about 16 days. In still other embodiments, Type II interferon receptor agonist treatment is discontinued once Type I or a Type III interferon receptor agonist treatment begins.

[0328] In additional embodiments, an NS3 inhibitor compound, a Type I or III interferon receptor agonist, and a Type II interferon receptor agonist are co-administered for the desired duration of treatment in the methods described herein. In some embodiments, an NS3 inhibitor compound, an interferon-α, and an interferon-γ are co-administered for the desired duration of treatment in the methods described herein.

In some embodiments, the dosage of peginterferon alfa-2a can be about 180 μg of peginterferon alfa-2a per dose, administered subcutaneously once weekly for the desired treatment duration. In some embodiments, the dosage of peginterferon alfa-2a can be an amount in the range of about 1.0 μg to about 1.5 μg of drug per kilogram of body weight per dose, subcutaneously once or twice weekly for the desired treatment duration with the ITMN-191 and the ribavarin. In some embodiments, the dosage of ribavirin can be about 400 mg, about 800 mg, about 1000 mg or about 1200 mg of drug orally per day, optionally in two or more divided doses per day, for the desired treatment duration with the peginterferon alfa-2a and ITMN-191. In some embodiments, the dosage of ribavirin can be an amount of about 1000 mg of drug orally per day for patients having a body weight of less than 75 kg or an amount of about 1200 mg of drug orally per day for patients having a body weight of greater than or equal to 75 kg, optionally in two or more divided doses per day, for the desired treatment duration with the peginterferon alfa-2a and ITMN-191.

[0476] In some embodiments, the amounts of peginterferon alfa-2a and ribavirin administered in the SOC protocol can be lowered due to combination with ITMN-191. For

example, the amounts of peginterferon alfa-2a and ribavirin can be reduced below the SOC by about 10% to about 75% during the combination treatment.

Subjects Suitable for Treatment

[0500] Any of the above treatment regimens can be administered to individuals who have been diagnosed with an HCV infection. Any of the above treatment regimens can be administered to individuals who have failed previous treatment for HCV infection ("treatment failure patients," including non-responders and relapsers).

[0501] Individuals who have been clinically diagnosed as infected with HCV are of particular interest in many embodiments. Individuals who are infected with HCV are identified as having HCV RNA in their blood, and/or having anti-HCV antibody in their serum. Such individuals include anti-HCV ELISA-positive individuals, and individuals with a positive recombinant immunoblot assay (RIBA). Such individuals may also, but need not, have elevated serum ALT levels.

[0502] Individuals who are clinically diagnosed as infected with HCV include naïve individuals (*e.g.*, individuals not previously treated for HCV, particularly those who have not previously received IFN-α-based and/or ribavirin-based therapy) and individuals who have failed prior treatment for HCV ("treatment failure" patients). Treatment failure patients include non-responders (*i.e.*, individuals in whom the HCV titer was not significantly or sufficiently reduced by a previous treatment for HCV, *e.g.*, a previous IFN-α monotherapy, a previous IFN-α and ribavirin combination therapy, or a previous pegylated IFN-α and ribavirin combination therapy); and relapsers (*i.e.*, individuals who were previously treated for HCV, *e.g.*, who received a previous IFN-α monotherapy, a previous IFN-α and ribavirin combination therapy, or a previous pegylated IFN-α and ribavirin combination therapy, whose HCV titer decreased, and subsequently increased).

[0503] In particular embodiments of interest, individuals have an HCV titer of at least about 10^5, at least about 5×10^5, or at least about 10^6, or at least about 2×10^6, genome copies of HCV per milliliter of serum. The patient may be infected with any HCV genotype (genotype 1, including 1a and 1b, 2, 3, 4, 6, etc. and subtypes (*e.g.*, 2a, 2b, 3a, etc.)),

particularly a difficult to treat genotype such as HCV genotype 1 and particular HCV subtypes and quasispecies.

In particular embodiments of interest, HCV-positive individuals with stage 3 or 4 liver fibrosis according to the METAVIR scoring system are suitable for treatment with the methods described herein. In other embodiments, individuals suitable for treatment with the methods of the embodiments are patients with decompensated cirrhosis with clinical manifestations, including patients with far-advanced liver cirrhosis, including those awaiting liver transplantation. In still other embodiments, individuals suitable for treatment with the methods described herein include patients with milder degrees of fibrosis including those with early fibrosis (stages 1 and 2 in the METAVIR, Ludwig, and Scheuer scoring systems; or stages 1, 2, or 3 in the Ishak scoring system.).

Preparation of NS3 Inhibitors

METHODOLOGY

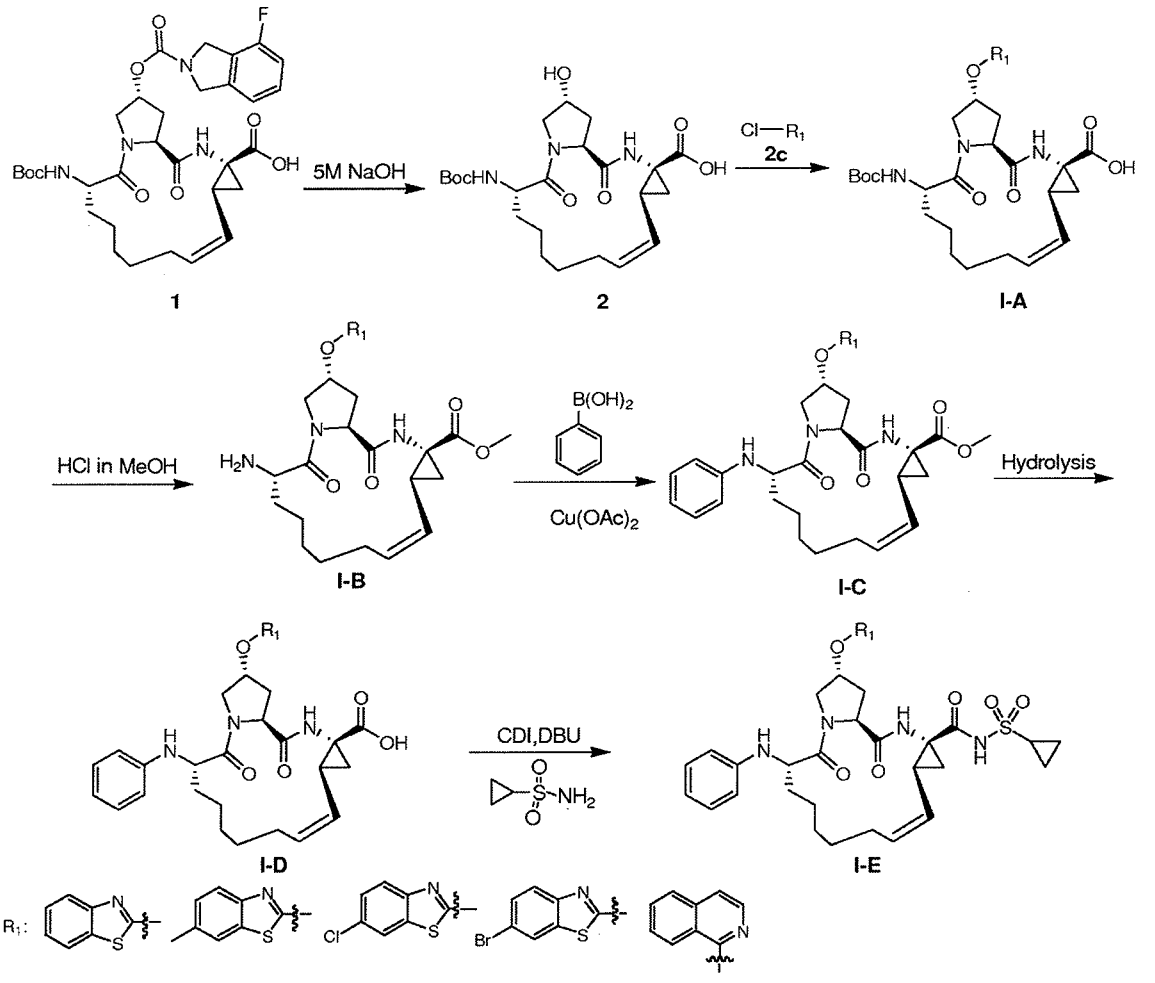

[0505] The HCV protease inhibitors in the following sections can be prepared according to the procedures and schemes shown in each section. The numberings in each of the following Preparation of NS3 Inhibitor sections including the General Method or General Procedure designations, are meant for that specific section only, and should not be construed or confused with the same numberings, if any, in other sections.

PREPARATION OF NS3 INHIBITORS: SECTION I

Example 1

General Synthesis A

Scheme I

[0506] Macrocyclics of general structures **I-D** and **I-E** can be synthesized as shown in **Scheme I**. The isoindoline carbamate **1** can be treated under basic conditions to hydrolyse the isoindoline carbamate thereby providing alcohol **2**. The alcohol 2 can be treated with a heteroaryl chloride, such as 2-chlorobenzothiazole, 2-chloro-6-methylbenzothiazole, 2,6-dichlorobenzothiazole, 6-bromo-2-chlorobenzothiazole, 1-chloroisoquinoline and the like, under basic conditions to afford a compound of general structure **I-A**. The compound of general structure **I-A** can be treated with acid in methanol to remove the Boc protecting group and form a methyl ester thereby providing a compound of general structure **I-B**. The compound of general structure **I-B** can be treated with optionally substituted aryl boronic acids under Cu^{2+}-catalyzed conditions thereby providing N-aryl

compounds of general structure **I-C**. The compounds of general structure **I-C** can be treated under basic conditions to hydrolyse the methyl ester thereby providing carboxylic acids of general structure **I-D**. Finally, acids of general structure **I-D** can be coupled with sulfonamides (or sulfamides, not shown) thereby providing compounds of general structure **I-E**.

Example 1-1:

General Procedure A

[0507] Compound **1** (10 g, 15.9 mmol.) was dissolved in methanol (100 mL), 5 M NaOH solution (95 mL) was added , the resulting mixture was heated to 50 °C and stirred overnight, after completion of the reaction. The mixture was cooled by ice water, 2 M HCl was added to acidify the mixture to pH=3-4, then the mixture was extracted by EtOAc, the organic layers were combined, washed by brine, dried, the solvent was removed under reduced pressure, the crude compound **2** (7.5 g) was used directly in the next step.

Example 1-2:

General Procedure B

[0508] A solution of Compound **2** (5 g, 1 mL/100 mg) in DMF was added slowly to a mixture of NaH was dissolved in DMF (1.5 mL/100 mg NaH), cooled to 0-5 °C. The mixture was stirred for 2 h at 0-5 °C, then heteroaryl halide (**2c**) was added, the resulting mixture was warmed to room temperature and stirred for 12 h. The mixture was cooled to 0 °C (ice water bath), then 2 M HCl was carefully added to lower the pH (pH=3-4). The acidic mixture was extracted by EtOAc. The combined organic layers were washed by brine and dried. The solvent was removed under reduced pressure and the crude product was purified by column chromatography to afford general compound **I-A** (3.0 g, 60-70% yield).

Example 1-3:

General Procedure C

[0509] General compound **I-A** (3.0 g) was dissolved in HCl in MeOH (25 mL/g, compound **I-A**), the resulting mixture was stirred at room temperature for 12 h. The solvent was removed then aqueous $NaHCO_3$ was added to neutralize any remaining acid. The basic mixture was extracted by EtOAc. The EtOAc layer was dried and then the solvent was

removed to afford a crude residue. Crude general compound **I-B** (2.8 g) was used without further purification in the next step.

Example 1-4:

General Procedure D

[0510] A mixture of general compound **I-B** (400 mg, 0.80 mmol.), phenylboronic acid (146.8 mg, 1.2 mmol.), $Cu(OAc)_2$ (188 mg, 1.0 mmol.), pyridine (316 mg, 4 mmol.), pyridine N-Oxide (76 mg, 0.8 mmol.) and molecular sieves 4Å in dichloromethane (10 mL) was stirred for 12 h at room temperature in a vessel opened to the air. During this time period, the reaction was monitored by LC-MS. Subsequently, another 1.5 eq boronic acid was added with continued stirring. After completion of the reaction, the solvent was removed and the crude mixture was purified by prep-HPLC to give the pure general compound **I-C** (80 mg, isolated yield 15%). If excessive boronic acid was used, N,N diphenyl product was obtained.

Example 1-5:

General Procedure E

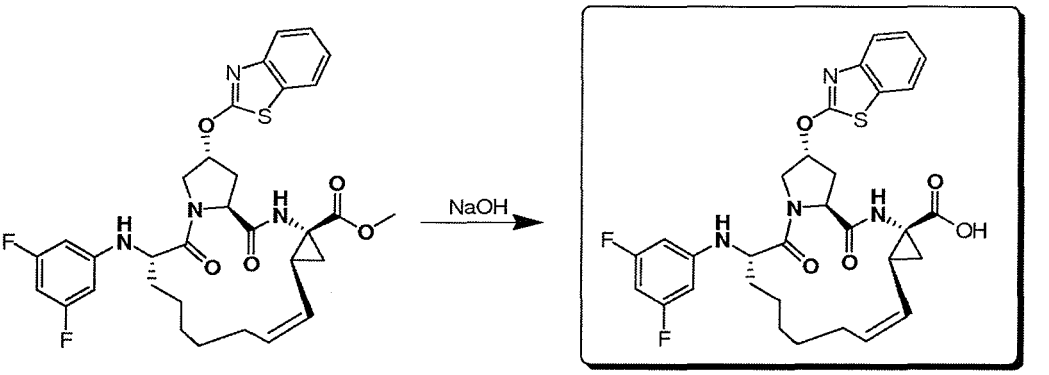

[0511] General compound **I-C** was dissolved in methanol (10 mL/1 g compound **I-C**), 2 M aqueous NaOH (8 mL/1 g compound **I-C**) was added to the methanol solution and the resulting mixture was stirred at room temperature overnight. The mixture was cooled to 0 °C (ice water bath), then 2 M HCl was carefully added to lower the pH (pH=3-4). The acidic mixture was extracted by EtOAc. The combined organic layers were washed by brine and dried. The solvent was removed under reduced pressure and the crude product was purified by prep-TLC (EtOAc/methanol=10:1) to afford general compound **I-D** (yield, 90-100%).

Example 1-6:

General Procedure F

[0512] General compound **I-D** (60 mg, 0.14 mmol. in 2 mL dichloromethane) was added to CDI (45.6 mg, 0.28 mmol.) dissolved in dichloromethane (1 mL) and then stirred 1 h. Subsequently, cyclopropyl sulfonamide (25.4 mg, 0.21 mmol.) and DBU (0.2 mL, 5.0 eq) were added, the resulting mixture was stirred at room temperature for another 12 h monitoring by LCMS. The solvent was then removed and the crude product was purified by prep-HPLC to give the pure general compound **I-E** as a white solid (~50% yield).

[0639] (1*R*,2*R*)-1-amino-2-vinyl-cyclopropane-1-carbonyl-(1'-methyl)-cyclopropane-sulfonamide hydrochloride salt can be synthesized as shown in **Scheme XIV**. Ethyl (1*R*,2*R*)-1-(*tert*-butoxycarbonylamino)-2-vinyl-cyclopropane-1-carboxylate can be treated under basic conditions, for example lithium hydroxide in a water-THF mixture, to hydrolyse the ethyl ester thereby providing (1*R*,2*R*)-1-(*tert*-butoxycarbonylamino)-2-vinyl-cyclopropane-1-carboxylic acid. (1*R*,2*R*)-1-(*tert*-butoxycarbonylamino)-2-vinyl-cyclopropane-1-carboxylic acid can be coupled with 1-methyl-cyclopropanesulfonamide, for example using 1,1'-Carbonyldiimidazole in the presence of DBU, to provide (1*R*,2*R*)-1-(*tert*-butoxycarbonylamino)-2-vinyl-cyclopropane-1-carbonyl-(1'-methyl)-cyclopropanesulfonamide. (1*R*,2*R*)-1-(*tert*-butoxycarbonylamino)-2-vinyl-cyclopropane-1-carbonyl-(1'-methyl)-cyclopropanesulfonamide can be treated under acidic conditions, for

example using a mixture of hydrochloric acid and dioxane, to remove the Boc protecting group thereby providing (1*R*,2*R*)-1-amino-2-vinyl-cyclopropane-1-carbonyl-(1'-methyl)-cyclopropane-sulfonamide hydrochloride salt.

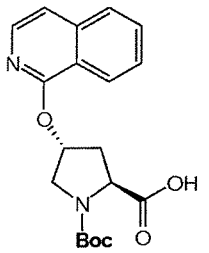

Scheme XVI: General Route for synthesis of Macrocycle.

[0683] Macrocycles, such as compound **346**, can be synthesized as shown in **Scheme XVI**. (2*S*,4*R*)-1-(*tert*-Butoxycarbonylamino)-4-hydroxy-proline can be treated with a heteroaryl chloride, such as 2-phenyl-4-chloro-7-methoxy-quinoline, 1-chloro-isoquinoline and the like, under basic conditions, for example potassium *tert*-butoxide in DMSO, to provide heteroaryl ethers, such as (2*S*,4*R*)-1-(tert-butoxycarbonylamino)-4-(1-isoquinolin-1-oxy)-proline. The heteroaryl ethers, such as (2*S*,4*R*)-1-(tert-butoxycarbonylamino)-4-(1-isoquinolin-1-oxy)-proline, can be coupled with amino acylsulfonamides, such as (1*R*,2*R*)-1-Amino-2-vinyl-cyclopropane-1-acyl-(1'-methyl)cyclopropanesulfonamide, using a coupling agent, for example using HATU in DMF in the presence of DIPEA, to provide dipeptides such as compound **22**. Compound **22** can be treated under acidic conditions, for example HCl in dioxane, to remove the Boc protecting group thereby forming free amines, such as compound **23**. Free amines, such as compound **23**, can be coupled with N-aryl amino acids, such as 2-(3-trifluoromethyl-5-fluoro-phenylamino)-non-8-enoic acid, using a coupling agent, for example using HATU in DMF in the presence of DIPEA, to provide macrocyclization precursors, such as compound **24**. Finally, the macrocyclization precursors, such as compound **24**, can be cyclized in the presence of a catalyst, for example a Zhan catalyst, to provide macrocycles, such as compound **346**.

General Procedure KK

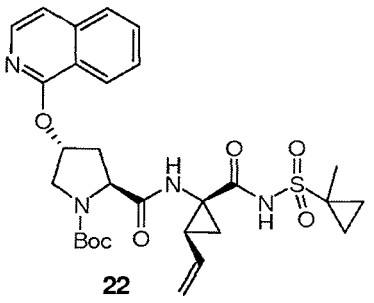

[0684] Preparation of (2*S*,4*R*)-1-(*tert*-butoxycarbonylamino)-4-(1-isoquinolin-1-oxy)-proline:

[0685] (2*S*,4*R*)-1-(*tert*-Butoxycarbonylamino)-4-hydroxy-proline (1.00 g, 4.64 mmol., 1.0 eq.) and dimethylsulfoxide (40 mL) were charged into a 100 mL round bottom flask. Potassium *tert*-butoxide (1.04 g, 9.3 mmol., 2.0 eq.) was added portionwise over 10 minutes at ambient temperature followed by 1-chloro-isoquinoline (0.836 g, 5.11 mmol., 1.1 eq.). Stirring was continued at ambient temperature for a further 15 hrs by when LCMS analysis of the reaction mixture showed the reaction to be complete. The reaction mixture was partitioned between ethyl acetate (80 mL) and water (40 mL). The phases were separated and the aqueous phase further extracted with ethyl acetate (40 mL). The organic phases were combined to give "organic phase 1". The aqueous phase was acidified to pH 3 with 1M hydrochloric acid and extracted with ethyl acetate (2 x 50 mL). The organic extracts were combined to give "organic phase 2". Organic phase 1, being contaminated with traces of chloroisoquinoline, was extracted with 1M aqueous sodium hydrogen carbonate solution (50 mL). The aqueous phase (pH 8) was washed with ethyl acetate (2 x 40 mL) and acidified to pH 3 with 1M hydrochloric acid. The aqueous phase was then extracted with ethyl acetate (2 x 80 mL). The organic extracts were pooled and combined with "organic phase 2". The resulting solution was dried over sodium sulfate, filtered and the solvent removed under vacuum to give 1.86 g (92% corrected for solvent) of the title compound which contained residual dimethylsulfoxide (18% w/w). ^{1}H NMR (500 MHz, $CDCl_3$) δ ppm 8.19 (dd, J = 8.44, 13.39 Hz, 1 H), 7.91 - 8.04 (m, 1 H), 7.71 - 7.82 (m, 1 H), 7.68 (t, J = 7.24 Hz, 1 H), 7.55 (t, J = 7.43 Hz, 1 H), 7.21 - 7.27 (m, 1 H), 5.82 (br. s, 1 H), 4.42 - 4.75 (m, 1 H), 3.77 - 4.00 (m, 2 H), 2.67 - 2.80 (m, 1 H), 2.41 - 2.65 (m, 1 H), 1.46 (s, 9 H). 346

[0692] Preparation of compound 346:

[0693] The macrocyclization precursor compound **24** (200 mg, 0.250 mmol., 1.0 eq.) and toluene (10 mL, previously degassed by bubbling nitrogen through the solvent for 30 min) were charged in a 25 mL round bottom flask previously flushed with nitrogen gas (It is important to keep the reaction mixture under a protective nitrogen atmosphere as much as possible). Zhan catalyst (1.6 mg, 2 mol%) was added and the reaction mixture heated at 65 °C for 1 hour with constant nitrogen gas bubbling through the reaction mixture (via needle). LCMS analysis showed 80% conversion, so a further 1 mol% catalyst was added and the stirring continued at 65 °C. After one 1 hour all starting material had been consumed so heating was stopped and the reaction mixture left to cool down to ambient temperature. N-methyl-ethylenediamine (24 mg, 10 times the catalyst weight) was added and the reaction mixture stirred for a further 15 minutes. The solvent was removed under vacuum and the residue partitioned between ethyl acetate (20 mL) and water (10 mL). The organic layer was collected and the pH of the aqueous phase adjusted to 6-7 with 0.5M hydrochloric acid. The aqueous phase was further extracted with ethyl acetate (2 x 20 mL). The organic phases were combined, dried over sodium sulfate, filtered and concentrated under vacuum. The residue was purified by flash column chromatography, using a methanol:dichloromethane gradient (from 0.5% to 1% methanol in dichloromethane). General Procedure KKLS

[0697] A preparation of (2*S*,4*R*)-1-(*tert*-butoxycarbonylamino)-4-[2-(3'-isopropyl-thiazol-2yl)-7-methoxy-8-methyl-quinoline-4-oxy]-proline was also completed using the following procedure: (*2S,4R*)-1-(*tert*-Butoxycarbonylamino)-4-hydroxy-proline (24.25 g, 105 mmol, 1.0 eq.) and dimethylsulfoxide (350 mL) were charged into a 2 L round bottom flask.

Potassium *tert*-butoxide (23.56 g, 210 mmol, 2.0 eq.) was added portionwise over 10 minutes at ambient temperature. The reaction mixture was stirred for 1 hour at ambient temperature while the colour changed from pale yellow to dark orange. 2-(4-isopropylthiazol-2-yl)-4-chloro-7-methoxy-8-methyl-quinoline (35.00 g, 105 mmol, 1.0 eq.) was added portionwise leading to the formation of a brown sticky residue. Further dimethylsulfoxide (150 mL) was added to help solubilizing the reagents and the stirring was continued at 35°C for a further 20 min. As the reaction mixture remained very thick more dimethylsulfoxide (300 mL) was added. The resulting mixture was stirred at 28°C for 15 hours by which time LCMS analysis of the reaction mixture showed the reaction to be complete. The reaction mixture was diluted with methanol (300 mL) and stirred for 30 min. The reaction mixture was left to cool to ambient temperature and split into two portions to ease the work up. Both fractions were treated in the same way as follows. The mixture was diluted with ethyl acetate (500 mL) and water (300 mL). The aqueous phase was acidified to pH 3 with 1M hydrochloric acid (~ 80 mL) and extracted with ethyl acetate (3 x 200 mL). The organic extracts were combined, washed with water (5 x 350 mL) and brine (300 mL), dried over sodium sulfate, filtered and the solvent removed under vacuum to give 24 g and 25 g of crude product respectively. Each solid was purified separately by dry flash chromatography onto 500 g of silica and eluting with a dichloromethane:methanol gradient (from neat dichloromethane to 5% methanol in dichloromethane). After combining the relevant fractions and solvent removal 20.6 g (37%) and 21.7 g (39%) of the desired product were isolated as a yellow solid. The combined yield was 42.3 g (76%). ^{1}H NMR (500 MHz, $CDCl_3$) δ ppm 7.89 - 8.03 (m, 1 H) 7.44 - 7.56 (m, 1 H) 7.24 (d, *J*=9.16 Hz, 1 H) 7.04 (br. s, 1 H) 5.39 (br. s, 1 H) 4.69 (s, 1 H) 4.47 - 4.60 (m, 1 H) 4.00 (s, 3 H) 3.98 (br. s, 1 H) 3.78 - 3.88 (m, 1 H) 3.18 - 3.25 (m, 1 H) 2.71 (s, 3 H) 1.47 (s, 9 H) 1.42 - 1.45 (m, 1 H) 1.40 (d, *J* = 6.71 Hz, 6 H) 1.36 - 1.38 (m, 1 H). Scheme XVII: Olefin Metathesis route to N-Aryl Acylsulfonamides

[0726] Macrocycles, such as compound **358**, can be synthesized as shown in **Scheme XVII**. (2*S*,4*R*)-1-(*tert*-Butoxycarbonylamino)-4-hydroxy-proline can be treated with a heteroaryl chloride, such as 2-(4-isopropylthiazol-2-yl)-4-chloro-7-methoxy-8-methyl-quinoline and the like, under basic conditions, for example potassium *tert*-butoxide in DMSO, to provide heteroaryl ethers, such as (2*S*,4*R*)-1-(tert-butoxycarbonylamino)-4-[2-(3'-isopropyl-thiazol-2yl)-7-methoxy-8-methyl-quinoline-4-oxy]-proline. The heteroaryl ethers, such as (2*S*,4*R*)-1-(tert-butoxycarbonylamino)-4-[2-(3'-isopropyl-thiazol-2yl)-7-methoxy-8-methyl-quinoline-4-oxy]-proline, can be coupled with amino acylsulfonamides, such as (1*R*,2*R*)-1-amino-2-vinyl-cyclopropane-1-acyl-(1'-methyl)cyclopropanesulfonamide, using a coupling agent, for example using HATU in DMF in the presence of DIPEA, to provide dipeptides such as compound **43**. Compound **43** can be treated under acidic conditions, for example HCl in dioxane, to remove the Boc protecting group thereby forming amines, such as

compound **44**. Amines, such as compound **44**, can be coupled with N-aryl amino acids, such as 2-(3-trifluoromethyl-5-fluoro-phenylamino)-non-8-enoic acid, using a coupling agent, for example using HATU in DMF in the presence of DIPEA, to provide macrocyclization precursors, such as compound **45**. Finally, the macrocyclization precursors, such as compound **45**, can be cyclized in the presence of a catalyst, for example a Zhan catalyst, to provide macrocycles, such as compound **358**.

[0727] Synthesis of (2*S*,4*R*)-1-(*tert*-butoxycarbonylamino)-4-[2-(3'-isopropyl-thiazol-2yl)-7-methoxy-8-methyl-quinoline-4-oxy]-proline:

[0728] (2*S*,4*R*)-1-(*tert*-Butoxycarbonylamino)-4-hydroxy-proline (24.25 g, 105 mmol., 1.0 eq.) and dimethylsulfoxide (350 mL) were charged into a 2 L round bottom flask. Potassium *tert*-butoxide (23.56 g, 210 mmol., 2.0 eq.) was added portionwise over 10 min at ambient temperature. The reaction mixture was stirred for 1 hour at ambient temperature while the color changed from pale yellow to dark orange. 2-(4-isopropylthiazol-2-yl)-4-chloro-7-methoxy-8-methyl-quinoline (35.00 g, 105 mmol., 1.0 eq.) was added portionwise leading to the formation of a brown sticky residue. Further dimethylsulfoxide (150 mL) was added to help solubilizing the reagents and the stirring was continued at 35°C for a further 20 min. As the reaction mixture remained very thick more dimethylsulfoxide (300 mL) was added. The resulting mixture was stirred at 28°C for 15 hours by which time LCMS analysis of the reaction mixture showed the reaction to be complete. The reaction mixture was diluted with methanol (300 mL) and stirred for 30 min. The reaction mixture was left to cool to ambient temperature and split into two portions to ease the work up. Both fractions were treated in the same way as follows. The mixture was diluted with ethyl acetate (500 mL) and

water (300 mL). The aqueous phase was acidified to pH 3 with 1M hydrochloric acid (~ 80 mL) and extracted with ethyl acetate (3 x 200 mL). The organic extracts were combined, washed with water (5 x 350 mL) and brine (300 mL), dried over sodium sulfate, filtered and the solvent removed under vacuum to give 24 g and 25 g of crude product respectively. Each solid was purified separately by dry flash chromatography onto 500 g of silica and eluting with a dichloromethane:methanol gradient (from neat dichloromethane to 5% methanol in dichloromethane). After combining the relevant fractions and solvent removal 20.6 g (37%) and 21.7 g (39%) of the desired product were isolated as a yellow solid. The combined yield was 42.3 g (76%). ^{1}H NMR (500 MHz, $CDCl_3$) δ ppm 7.89 - 8.03 (m, 1 H), 7.44 - 7.56 (m, 1 H), 7.24 (d, J = 9.16 Hz, 1 H), 7.04 (br. s, 1 H), 5.39 (br. s, 1 H), 4.69 (s, 1 H), 4.47 - 4.60 (m, 1 H), 4.00 (s, 3 H), 3.98 (br. s, 1 H), 3.78 - 3.88 (m, 1 H), 3.18 - 3.25 (m, 1 H), 2.71 (s, 3 H), 1.47 (s, 9 H), 1.42 - 1.45 (m, 1 H), 1.40 (d, J = 6.71 Hz, 6 H), 1.36 - 1.38 (m, 1 H). General Procedure SSLS

[0741] Compound **44** (HCl salt, 4 g, 5.3 mmol, 1.0 eq.) and *N,N*-dimethylformamide (80 mL) were charged into a 250 mL round bottom flask under nitrogen. HATU (2.65 g, 6.4 mmol, 1.2 eq.) and diisopropylethylamine (6 mL, 32 mmol, 6.0 eq.) were added at 0°C and the reaction mixture stirred at ambient temperature for a further 15 minutes. (2*S*)-2-(3-trifluoromethyl-phenylamino)-non-8-enoic acid (2.01 g, 6.4 mmol, 1.2 eq.) was added as a single portion and stirring was continued at ambient temperature for a further 2 hours. Monitoring the reaction conversion by LCMS showed full consumption of the starting material. The solvent was removed under vacuum and the residue partitioned between ethyl acetate (80 mL) and water (80 mL). The organic phase was further washed with water (80 mL x 4), dried over sodium sulfate, filtered and concentrated to dryness. The residue was purified by flash column chromatography, using a dichloromethane:ethyl acetate gradient (from neat dichloromethane to 10% ethylacetate in dichloromethane). After combining the relevant fractions the solvent was removed under vacuum to give 3.08g (61%) of compound **49** as a yellow solid.

[0742] The residue was dissolved in toluene (300 mL) and decolorizing charcoal (924 mg, ~30 wt% of the residue mass) was added. The slurry was heated at 65°C for 30 minutes and the charcoal removed by filtration while still hot. The mixture was used in the next step. ^{1}H NMR (500 MHz, $CDCl_3$) δ ppm 10.12 (s, 1 H) 7.80 (d, J = 9.14 Hz, 1 H) 7.56 (br. s, 1 H) 7.17 (d, J = 9.30 Hz, 1 H) 7.07 - 7.12 (m, 1 H) 7.06 (s, 1 H) 6.88 - 6.95 (m, 2 H) 6.80 (s, 1 H) 6.67 (d, J = 8.04 Hz, 1 H) 5.71 - 5.83 (m, 2 H) 5.60 (br. s, 1 H) 5.23 (d, J = 17.18 Hz, 1 H) 5.12 (d, J = 10.40 Hz, 1 H) 4.98 (d, J = 17.18 Hz, 1 H) 4.93 (d, J = 10.09 Hz, 1 H) 4.86 (d, J = 9.14 Hz, 1 H) 4.46 (t, J = 8.28 Hz, 1 H) 4.19 (d, J = 11.35 Hz, 2 H) 4.06 - 4.15 (m, 1 H) 3.99 (s, 3 H) 3.21 (spt, J = 6.78 Hz, 1 H) 2.71 (s, 3 H) 2.64 (d, J = 7.25 Hz, 2 H) 1.97 - 2.08 (m, 4 H) 1.75 - 1.88 (m, 2 H) 1.71 (br. s, 2 H) 1.62 - 1.70 (m, 1 H) 1.54 - 1.62 (m, 1 H) 1.51 (s, 3 H) 1.29 - 1.45 (m, 10 H) 1.23 - 1.29 (m, 1 H) 0.89 - 0.95 (m, 1 H) 0.82 - 0.87 (m, 1 H). General Procedure TT

358

[0778] Compound **45** (552 mg, 0.541 mmol., 1.0 eq.) and toluene (83 mL, previously degassed by bubbling nitrogen through the solvent for 30 min) were charged in a 250 mL round bottom flask previously flushed with nitrogen gas and the reaction mixture heated to 65°C (it is important to keep the reaction mixture under a protective nitrogen atmosphere). Zhan catalyst (1.8 mg, 0.5 mol%) was added and the reaction mixture heated at 65°C for a further 20 minutes with constant nitrogen gas bubbling through the reaction mixture (*via* needle). During this time the reaction mixture color turned from pale yellow to pale orange. LCMS analysis showed 35% conversion of starting material to product, so further catalyst (1.8 mg, 0.5 mol%) was added and stirring continued for a further 25 minutes. LCMS analysis showed 80% conversion of starting material to product, so further catalyst (1.8 mg, 0.5 mol%) was added and stirring continued for a further 25 minutes. LCMS analysis showed 96% conversion of starting material to product so the reaction so the heating was stopped and the reaction mixture left to cool down to ambient temperature. The solvent was removed under vacuum. The residue was purified by flash column chromatography, using a methanol:dichloromethane gradient (from neat dichloromethane to 0.5% methanol in dichloromethane). After combining the relevant fractions and solvent removal, 308 mg (60%) of the title compound was isolated as a beige solid. ^{1}H NMR (500 MHz, $CDCl_3$) δ ppm 10.14 (s, 1 H), 7.76 (d, J = 9.16 Hz, 1 H), 7.49 (s, 1 H), 7.24 - 7.35 (m, 1 H), 7.11 (d, J = 9.46 Hz, 1 H), 7.03 (s, 1 H), 6.61 (s, 1 H), 6.58 (d, J = 8.24 Hz, 1 H), 6.33 (d, J = 10.99 Hz, 1 H), 5.57 - 5.67 (m, 1 H), 5.52 (br. s, 1 H), 4.83 - 4.93 (m, 2 H), 4.66 (t, J = 7.78 Hz, 1 H), 4.18 - 4.25

General Procedure TTLS

[0781] Compound **49** as a solution in toluene (3.08 g, 3.24 mmol, 1.0 eq.) and toluene (162 mL, previously degassed by bubbling nitrogen through the solvent for 30 min) were charged in a 500 mL round bottom flask previously flushed with nitrogen gas and the reaction mixture heated to 65°C to give a clear yellow solution (it is important to keep the reaction mixture under a protective nitrogen atmosphere). Zhan catalyst (10.7 mg, 0.5 mol%) was added and the reaction mixture heated at 65°C for a further 20 min with constant nitrogen gas bubbling through the reaction mixture (*via* needle). During this time the reaction mixture color turned from pale yellow to pale orange (56% conversion by LCMS-UV). Another catalyst aliquot (10.7 mg, 0.5 mol%) was added and the reaction mixture stirred for a further 20 min. As LCMS analysis showed some residual starting material (97% conversion by LCMS-UV) a third catalyst aliquot was added (10.7 mg, 0.5 mol%) and the reaction mixture was stirred for a further 20 min. LCMS-UV analysis showed full consumption of the starting material. The solvent was removed under vacuum. Example 21

Scheme XVIII: General Route for the Preparation of Macrocyclic Acylsulfonamides and Acylsulfamides

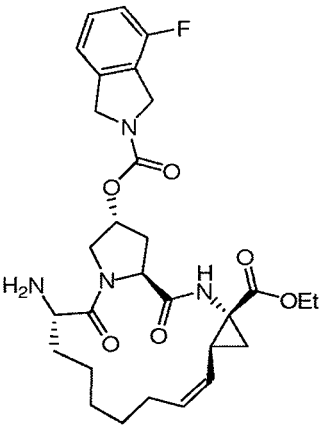

[0808] Macrocyclic protease inhibitors of general structures **XXVIII-C** and **XXVIII-D** were synthesized as shown on **Scheme XVIII** from synthetic precursor **16** ("RCM Ester). Compound **16** was treated under acidic conditions, for example with HCl-dioxane, to generate free amino derivative **17**. Next, this compound was arylated with an optionally substituted boronic acids under Cu^{2+}-catalyzed conditions to yield N-aryl intermediates of general structure **XXVIII-A**. Simultaneous basic hydrolysis of carbamate and ester functions, for example aqueous sodium hydroxide in ethanol, afforded hydroxy carboxylic acids of general structure **XXVIII-B**, which were then reacted with a heteroaryl chloride, such as 2-(4-isopropylthiazol-2-yl)-4-chloro-7-methoxy-8-methyl-quinoline and the like, under basic

conditions, for example sodium hydride in DMF, to furnish acids of the general structure **XXVIII-C**. Finally, these acids were coupled with sulfonamides or sulfamides, for example using CDI in the presence of DBU, to give the target compounds of general structure **XXVIII-D**.

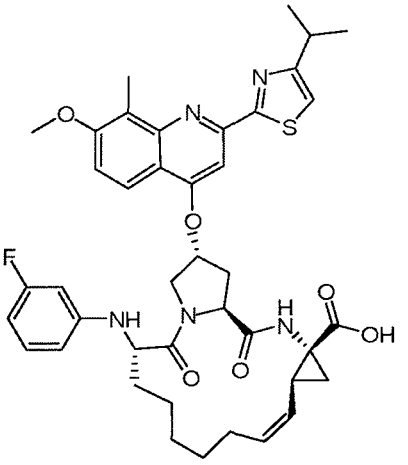

Scheme XIX: General Route for Synthesis of 411

[0817] Compound **63** can be treated under basic conditions, for example aqueous sodium hydroxide in ethanol, can simultaneous hydrolyze the carbamate and ethyl ester functions thereby providing hydroxy carboxylic acids, for example compound **70**. The hydroxy carboxylic acids, for example compound **70**, can then reacted with a heteroaryl chloride, such as 2-(4-isopropylthiazol-2-yl)-4-chloro-7-methoxy-8-methyl-quinoline and the like, under basic conditions, for example sodium hydride in DMF, to furnish acids, such as compound **448**. Finally, these acids can be coupled, for example using CDI in the presence of DBU, with sulfonamides (e.g. cyclopropylsulfonamide) or sulfamides to provide macrocycles such as compound **411**.

Example 22-1

General Procedure WW

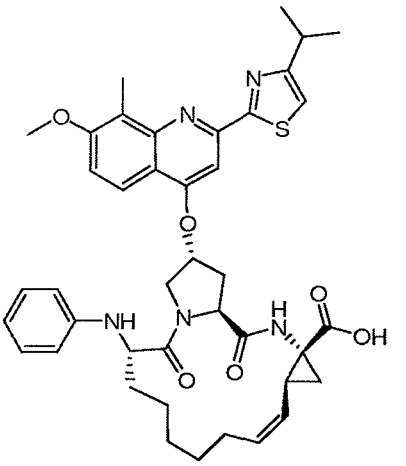

448

[0818] To a mixture of compound **63** (2.18 g, 3.35 mmol.) and ethanol (20 mL) was added aqueous sodium hydroxide (2N, 10 mL, 20 mmol.) and reaction mixture was stirred overnight at 70°C. Solvent was removed *in vacuo* and the residue was dissolved in water. The aqueous solution was acidified with 2N hydrochloric acid to pH ~3 and then extracted with ethyl acetate. Organic phase was dried over magnesium sulfate and evaporated to give crude intermediate **70** as a beige foam (~1.7 g), used on the next step without any further purification.

[0819] Crude compound **70** from the previous step (1.7 g) was co-evaporated twice with DMF and then dissolved in anhydrous DMF (10 mL). This solution was cooled down to 0°C and sodium hydride (60% dispersion in mineral oil, 536 mg, 13.4 mmol.) was added in one portion. The reaction was stirred at room temperature until hydrogen evolution subsided (30-40 min), then 4-chloro-2-(4-isopropylthiazol-2-yl)-7-methoxy-8-methylquinoline (1.12 g, 3.35 mmol.) was added to the stirring mixture. The reaction was allowed to proceed overnight at 40°C. After addition of water and 2N hydrochloric acid the reaction mixture was extracted with ethyl acetate. Organic phase was washed with water, dried over magnesium sulfate, and evaporated. The desired acid (**448**) was isolated by flash chromatography in 2-4% methanol in DCM to afford 1.88 g (74% over two steps), pale yellow foam. . ^{1}H-NMR (DMSO-d^{6}), δ: 12.3 (br. s, 1 H), 8.68 (s, 1 H), 7.88 (d, 1 H), 7.58 (s, 1 H), 7.48 (s, 1 H), 6.68 (dd, 1 H), 6.44 (d, 1 H), 6.33 (d, 1 H), 6.21 (dd, 1 H), 5.88 (d, 1 H), 5.73 (m, 1 H), 5.52 (m, 1 H), 5.33 dd, 1 H), 4.51 (dd, 1 H), 4.34-4.40 (m, 2 H), 3.98-4.05 (m,

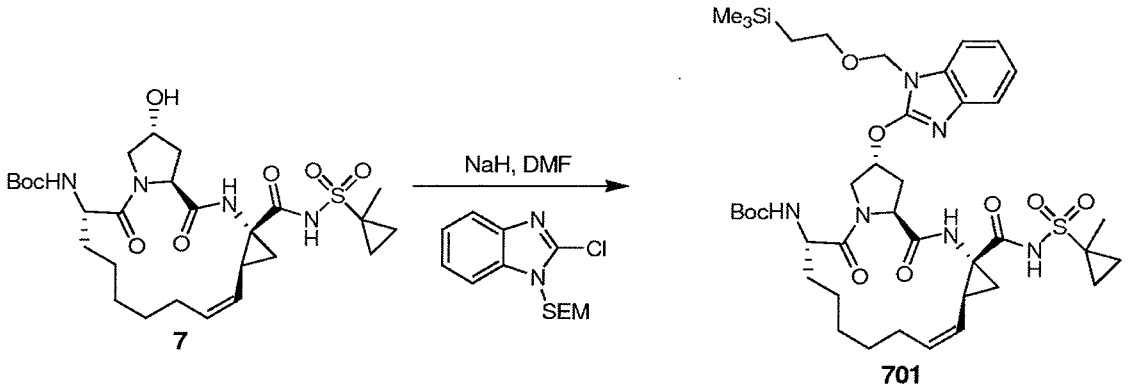

Scheme XXX

[0922] Compound **1079** can be synthesized by the method of Scheme **XXX**. The benzimidazole can be introduced by use of a SEM protected benzimidazole, 1-((2-(trimethylsilyl)ethoxy)methyl)-2-chloro-1*H*-benzo[*d*]imidazole. The SEM protecting group can be introduced by treatment of 2-chloro-1*H*-benzo[*d*]imidazole with a base, such as sodium hydride, potassium hydride and the like, followed by addition of 2-(trimethylsilyl)ethoxymethyl chloride (SEMCl) thereby providing 1-((2-(trimethylsilyl)ethoxy)methyl)-2-chloro-1*H*-benzo[*d*]imidazole (1.13 g, 60.8%). The alcohol, compound **7**, can be treated with a base, such as sodium hydride, potassium hydride, lithium hydride, cesium carbonate, sodium carbonate, potassium carbonate, potassium *tert*-butoxide, and the like, then reacted with 1-((2-(trimethylsilyl)ethoxy)methyl)-2-chloro-1*H*-benzo[*d*]imidazole to afford compound **701**. The SEM and Boc groups can be removed under acidic conditions to afford compound **702**. For example, the acid can be trifluoroacetic

acid, hydrochloric acid, and the like. The Boc group can then be re-introduced by treatment of compound **702** with $(Boc)_2O$ in the presence of a base, such as cesium carbonate, sodium carbonate, potassium carbonate, sodium bicarbonate, potassium bicarbonate, and the like, to afford compound compound **1079**.

General Procedure for preparing 2-thiol benzoxazole or benzothiazole intermediates:

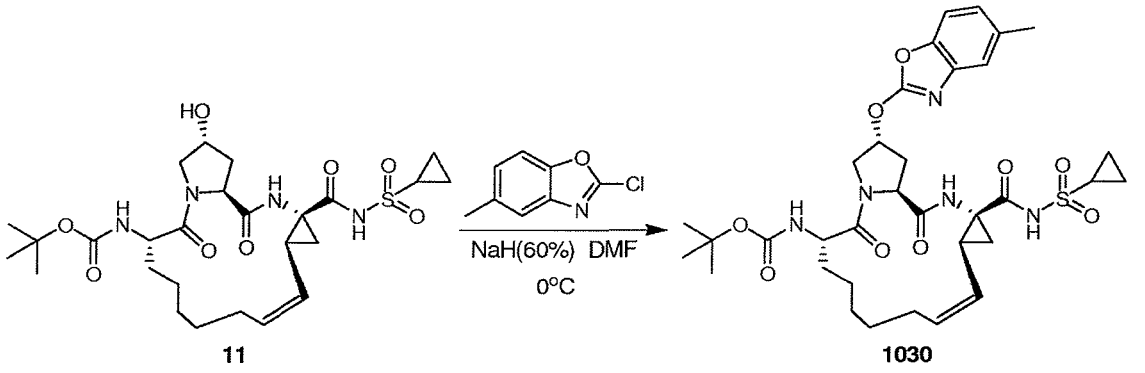

[0953] Potassium ethyl xanthate (4.4 g, 27.5 mmol.) was added to solution of 2-amino-4-methyl-phenol (2 g, 16.2 mmol.) in ethanol (40 mL). The reaction mixture was heated at reflux for 4 h then allowed to cool to rt. Upon cooling to rt the mixture was concentrated and the resulting residue was dissolved in water. Acetic acid was added until ~pH=5 and a white solid precipitated from the solution. The solid was collected by filteration, washed with water and dried to afford 5-methylbenzo[*d*]oxazole-2-thiol as a powder (2.4 g, 92.3%) which was used without further purification. After 4 h of stirring at room temperature, the reaction mixture was concentrated to remove excess $POCl_3$, and the residue was treated with Na_2CO_3 solution until ~pH 8 was reached. The aqueous phase was extracted with CH_2Cl_2. The combined organic extracts were dried over Na_2SO_4, filtered and concentrated to afford 2-chloro-5-methylbenzo[*d*]oxazole (1.1 g crude product) which was used without further purification. Compound **17** (1g, 1.8 mmol, 1 eq.) was added as a single portion and the reaction mixture was stirred for a further 5 min by when the initial light blue solution had turned dark blue. 3-fluoro-5-(trifluoromethyl)phenylboronic acid (370 mg, 1.8 mmol, 1 eq.) was added portion wise. For example, NS3/NS4 complexes may be formed and inhibitory concentrations of test compounds determined as described in U.S. Patent Application Publication Number 2007/0054842 paragraph numbers 1497-1509, which is incorporated herein by reference in its entirety. Similarly, hepatitis C replicon EC_{50} may be determined using known assay methods such as described in U.S. Patent Application Publication Number 2007/0054842 paragraph numbers 1510-1515. Assays may be conducted at ambient temperature (23 °C) in assay buffer containing 50 mM Tris-HCl, pH 7.5, 15% glycerol, 0.6 mM Lauryldimethylamine Oxide (LDAO), 25 μM NS4A peptide, and 10 mM Dithiothreitol (DTT).

[1135] Inhibition of NS3/NS4 activity was determined for several compounds exemplified herein and is presented in Tables 2 and 3.

Example 62-1 – ITMN-191 Treatment Effect on HCV viral load (Comparative)

Monotherapy:

ITMN-191

[1136] The study was designed to provide the plasma pharmacokinetics (PK) of multiple ascending daily oral doses of ITMN-191 monotherapy and to evaluate the viral kinetics (VK) of multiple ascending daily oral doses of ITMN-191 monotherapy in patients, as measured by changes from Baseline in hepatitis C virus ribonucleic acid (HCV RNA) levels. The ITMN-191 was administered in the form of its sodium salt.

Proposed Dose Escalation:

[1137] In Part A and Part B, up to six cohorts (treatment arms) of 10 patients each were planned. In Part A, up to five cohorts of 10 treatment-naïve patients per cohort were planned to receive multiple ascending doses of study drug. Patients within each of the five cohorts were randomly assigned 8:2 to receive either ITMN-191 or placebo for 14 days. In Part B, one cohort of non-responder (NR) patients (Cohort 6) was planned to receive a single dose level of study drug for 14 days. Patients in Cohort 6 were randomly assigned 8:2 to

receive either ITMN-191 (8 patients) or placebo (2 patients). Table S-1 provides the proposed cohorts and doses.

Table S-1 Proposed Cohorts and Study Drug Doses (Active/Placebo)

2	100 mg	q8h	300 mg	8/2	Naïve
3	200 mg	q12h	400 mg	8/2	Naïve
4	200 mg	q8h	600 mg	8/2	Naïve
5[b]	300 mg	q8h	900 mg	8/2	Naïve
Part B (Nonresponder)					
6[b]	300 mg	q8h	900 mg	8/2	NR

- Notes: q12h = every 12 hours; q8h = every 8 hours. Naïve = never previously received IFN-based monotherapy or combination therapy for their condition. NR = nonresponders.
- The number of patients excludes potential replacement patients.

[b]The total daily dose (TDD) was not to exceed 900 mg.

Number of Patients:

[1138] Planned enrollment: 60 patients (10 per cohort). Actual enrollment: 50 patients.

[1139] In Part A, there were 32 males and 8 females, ranging in age from 26 to 65 years old

[1140] Patients who met all of the following criteria were eligible to participate in the study:

Between 18 and 65 years of age, inclusive, at the time of dosing;

History of chronic hepatitis C genotype 1, documented with HCV genotype and detectable HCV RNA levels at the Screening Visit;

HCV treatment history:

Part A: Treatment-naïve (i.e., had never received IFN-based monotherapy or combination therapy for their condition)

Part B: NR (nonresponders), defined as:

Previously treated with the combination of PEG-IFNα plus RBV; and

Failed to achieve a ≥ 2 $\log_{10}$ reduction in HCV RNA at Week 12, or detectable HCV RNA levels at Week 24 or beyond while on therapy;

Liver biopsy or noninvasive (e.g., fibroscan) procedure in the past 2 years showing absence of cirrhosis; and

At the Screening Visit, cardiac troponin values below the 99th percentile based on assessment with both protocol-specified cardiac troponin immunoassays.

[1141] The treatment period consisted of 14 days of blinded study drug. In Part A, optional Standard of Care (SOC) consisting of PEG-IFN-α plus ribivarin (RBV) therapy was provided to treatment-naïve patients 24 hours after the last dose on Day 14. In Part B, NR patients were not permitted to start any additional HCV therapy before Day 44.

Part A (Treatment-Naive Patients):

[1142] Overall age ranged from 25 years to 65 years. Most of the treatment-naïve patients were male (80%) and European (90%). Median BMI ranged from 23.6 kg/m^2 to 26.9 kg/m^2, with an overall range of 19 kg/m^2 to 31 kg/m^2. The median duration since HCV diagnosis ranged from 2 years to 7.5 years, with an overall range of 1 year to 34 years. Median HCV RNA $\log_{10}$ levels ranged from 5.73 $\log_{10}$ IU/mL to 6.46 $\log_{10}$ IU/mL. Median ALT levels ranged from 56 U/L to 74 U/L with an overall range of 26 U/L to 241 U/L.

Part B (NR Patients):

[1143] Overall age ranged from 25 years to 62 years. Of the 10 NR patients, 8 were male (ITMN-191), 2 were female (placebo), and 100% were European. Median BMI ranged from 23.5 kg/m^2 to 25.1 kg/m^2, with an overall range of 19 kg/m^2 to 30 kg/m^2. The median duration since HCV diagnosis ranged from 1 year to 9.5 years, with an overall range of 1 to 16 years. Median HCV RNA levels ranged from 6.47 $\log_{10}$ IU/mL to 6.64 $\log_{10}$ IU/mL, with an overall range of 5.98 $\log_{10}$ IU/mL to 7.63 $\log_{10}$ IU/mL. Median ALT levels ranged from 62.5 U/L to 75.5 U/L, with an overall range of 26 U/L to 152 U/L.

Patient Disposition

[1144] All patients completed 14 days of treatment (40 on ITMN-191 and 10 on placebo). During the 14-day dosing period, 3 treatment-naïve patients in the 200 mg q12h treatment arm received less than the assigned daily dose of blinded study drug dose (2 patients received 100 mg q12h of ITMN-191 during the entire 14 days, and 1 patient received 100 mg q12h of ITMN-191 during Day 1 through the first dose of Day 5 of the dosing period). Of the 50 enrolled patients, 49 completed through Day 44 (1 patient was lost to follow-up after Day 21), and 48 patients completed through Day 90. Among treatment-naïve patients, 31/40 initiated optional SOC treatment on Day 15, and among NR patients, 7/10 initiated optional SOC treatment on Day 44.

[1145] Efficacy was evaluated by log_{10} reductions in HCV RNA levels and reductions in ALT values using the Efficacy-Evaluable Population, defined as those patients who received at least 90% of prescribed doses of assigned blinded study drug. Three patients in the treatment-naive 200 mg q12h cohort received less than the assigned randomized dose and were excluded from all efficacy analyses. The HCV RNA levels were determained by Roche COBAS Taqman HCV/HPS test, v2.0. This is a reverse transcriptase PCR method.

Viral Kinetics (VK)

Part A (Treatment-Naive Patients)

[1146] In the treatment-naïve patients, ITMN-191 treatment resulted in generally rapid, sustained (over the 14-day treatment period), dose-dependent reductions in HCV RNA levels, with median reductions of -3.12 log_{10} IU/mL in the 200 mg q12h cohort and -3.76 log_{10} IU/mL for the 200 mg q8h cohort at end of treatment (EOT) (Day 14). Similarly, median maximum reductions in HCV RNA levels in the 200 mg q12h and 200 mg q8h cohorts were -3.17 log_{10} IU/mL and -3.90-log_{10} IU/mL, respectively. Median ALT values declined from elevated Baseline levels in all ITMN-191 cohorts during study treatment, with the largest median EOT reduction of -37.5 U/L observed in the 200 mg q8h cohort.

Part B (NR Patients)

[1147] In the NR patients, 300 mg q8h of ITMN-191 treatment resulted in a median reduction of -2.46 log_{10} IU/mL at EOT. The median maximum reduction in HCV RNA levels was -2.93 log_{10} IU/mL. The median ALT value declined from an elevated Baseline level by -34.5 U/L at EOT.

Viral Resistance

[1148] In Parts A and B, rebound, plateau, and continuous decline of virologic response profiles were defined based on the HCV RNA level at end of treatment (EOT) relative to the nadir HCV RNA level. In general, patients experiencing virologic rebound (14/40 patients) and plateau (12/40 patients) were observed in the lower dose treatment arms, while the majority of patients (14/40 patients) experiencing a continual decline in HCV RNA level were observed in the upper dose treatment arms. The frequency of rebound for treatment-naïve patients (Part A) was higher in the 100 mg q2h treatment arm (4 patients) than in the higher dose treatment arms (2 to 3 patients). The frequency of rebound for NR

patients (Part B) was the same (2 patients) as for the treatment-naïve patients in the 100 mg q8h treatment arm. However, there were no statistically significant differences in ITMN-191 AUC, C_{max}, or C_{τ} between rebound, plateau, and continual decline groups. At EOT, every patient classified as experiencing virologic rebound carried NS3 variants in which arginine at amino acid position 155 was replaced, at least in part, by lysine. Arginine substitution was observed 21 and 90 days following cessation of ITMN-191 administration in the majority of patients with amplifiable NS3 at those time points, indicating that NS3 bearing this substitution were genetically fit.

Conclusions:

[1149] ITMN-191 treatment provides a dose-dependent reduction in HCV RNA levels in treatment-naïve patients, with a daily dose of 200 mg q8h for 14 days providing the highest median reduction of HCV RNA levels of all the treatment arms. In the treatment-naïve cohorts (Part A) the median maximum post-Baseline $\log_{10}$ reduction in HCV RNA in the 200 mg q12h and the 200 mg q8h cohorts are -3.17 $\log_{10}$ IU/mL and -3.90 $\log_{10}$ IU/mL, respectively during study drug treatment. In the single NR cohort (Part B), the 300 mg q12h dose results in a more modest median maximum post-Baseline change in HCV RNA of -2.93 $\log_{10}$ IU/mL during study drug treatment. Virologic rebound occurred in 14 (35%) of the 40 ITMN-191 treated patients and was primarily associated with an R155K substitution in the NS3 protein coding sequence at end of treatment. ITMN-191 administration resulted in reductions in elevated Baseline ALT levels during 14 days of treatment in all cohorts.

Example 62-2 – ITMN-191 Treatment Effect on HCV viral load - Combination therapy

Study Design:

[1151] This is a double-blind, placebo-controlled, multicenter study in treatment-naïve patients with chronic hepatitis C genotype 1 infection. All patients receive standard of care (SOC) treatment with PEG-IFN alfa-2a and weight-based ribavirin in accordance with the product labeling. In addition to this standard of care treatment, patients are randomized to receive either ITMN-191 or matching placebo, administered in the fed state, for 14 complete days, and a single dose on Day 15. PEG-IFN alfa-2a and ribavirin is provided from Day 0 and following the completion of study drug treatment on Day 15 through Day 44. No other HCV therapies are permitted prior to Day 44. All patients receive SOC and then are administered a pill containing either ITMN-191 or placebo. The ITMN-191 was administered in the form of its sodium salt.

[1152] Patients are admitted to a research facility and initiate PEG-IFN alfa-2a and ribavirin on Day 0. Study drug (ITMN-191 or placebo) administration begins on Day 1 and continues to the morning of Day 15, and patients are discharged from the research facility on Day 16. Meals and activity levels are standardized across research facilities. Patients are contacted by telephone on Day 21 and return to the research facility for the Safety Follow-up Visit on Day 28 and the End of Study Visit on Day 44.

[1153] The initial ITMN-191 dose levels administered in this study resulted in exposures generally similar to those studied a completed multiple ascending dose study of ITMN-191 monotherapy (see Comparative Example 21-1 above).

[1154] Over the course of the study, blood samples are obtained for clinical laboratory analysis and for PK (pharmokinetics) and VK (viral kinetics). In addition, blood samples to assess VR (viral rebound) are obtained. To monitor potential cardiac toxicity, cardiac troponin are assessed every day during the treatment period.

Methods:

[1155] End of treatment (EOT) and nadir HCV RNA levels were used to define virologic rebound, continual decline, and plateau response patterns. NS3 protease domain was amplified and population sequenced by nested reverse transcription polymerase chain reaction

(RT-PCR). Amplicons were cloned into a novel NS3 phenotyping vector and this plasmid used for clonal sequencing. The HCV RNA levels were determained by Roche COBAS Taqman HCV/HPS test, v2.0. This is a reverse transcriptase PCR method.

Results:

[1156] After 14 days of triple combination therapy, the median change in HCV RNA from baseline exceeded 5 logs in five of the six cohorts and was -5.5 log and -5.7 log in the best performing q12h and q8h cohorts, respectively. At the end of only 14 days of treatment, HCV RNA was below the limit of quantification (<25 IU/mL) in nearly three-quarters (71%, or 32 of 45) of patients at all doses and intervals who received treatment with ITMN-191 as summarized in Table 5. In all q12h and q8h cohorts of ITMN-191 in combination with SOC, reductions in HCV RNA occurred rapidly and there was no evidence of the viral rebound seen during during ITMN-191 monotherapy treatment (see Comparative Example 62-1 above).

[3] HCV RNA at EOT (End of Treatment) Median HCV RNA was at or below the lower limit of quantification at EOT
[4] Values below Limit of Quantification (LOQ) of 25 IU/mL were assigned value of 1.236 log10
[5] Values below Limit of Detection (LOD) of 9.3 IU/mL were assigned value of 0.667 log10

[1157] The combination of ITMN-191 with SOC provides a much greater reduction in HCV RNA levels as compared to SOC alone, as evidenced by the median change of HCV RNA levels shown in Table 5. Further, the combination protocol prevents a viral rebound in all treatment groups, in contrast to patients treated with ITMN-191 alone where

viral rebound was observed. This extraordinary and rapid reduction in HCV RNA was not seen in patients under SOC and placebo treatment. It was observed that at least 57% of the patients treated with the combination therapy obtained HCV RNA levels below 25 IU/mL. Further, it was observed that at least 13% of the patients treated with the combination therapy obtained HCV RNA levels below 9.3 IU/mL (detection limit of analysis method). Additiionally, there was no viral rebound observed for any patients in the combination treatment groups.

[1158] Various trends are observed by comparing the earlier ITMN-191 monotherapy study (see Example 62-1) with the more recent combination study, as summarized in Table 5. The combination treatment provides (group 4 and group 6, Table 6) reduction of HCV RNA levels below 43 IU/mL in a significant percentage of the patients in each study group. This reduction is observed in the combination study where 100 mg of ITMN-191 was administered every 8 hours or 200 mg of ITMN-191 was administered every 8 hours. The baseline comparison can be seen in the placebo group (placebo alone) and the SOC treatment group (placebo with peginterferon alfa-2a and ribavirin) which did not show any patients with an HCV RNA level below 43 IU/mL after 14 days of treatment.

[1159] The superior virologic response of the combination therapy is evident by comparing the monotherapy cohorts to their corresponding combination therapy cohorts. The monotherapy cohort (group 3) where 100 mg of ITMN-191 was administered every 8 hours provided a reduction of HCV RNA levels below 43 IU/mL in 13% of patients after 14 days of treatment. In contrast, the corresponding cohort from the combination study where 100 mg of ITMN-191 was administered every 8 hours in combination with pegylated interferon-alfa and ribavirin provided a reduction of HCV RNA levels below 43 IU/mL in 75% of patients (group 4) after 14 days of treatment. The cohort from the monotherapy study where the amount of ITMN-191 was increased to 200 mg, again administered every 8 hours, provided a similar reduction of HCV RNA levels below 43 IU/mL in 13% of patients (group 5) after 14 days of treatment. Similar to the previous comparison, the corresponding cohort (group 6) where 200 mg of ITMN-191 was administered every 8 hours in combination with pegylated interferon-alfa and ribavirin provided a reduction of HCV RNA levels below 43 IU/mL in 88% of patients after 14 days of treatment. Thus, the combination cohorts provide a superior reduction in HCV RNA levels in comparison to the monotherapy cohorts, as evidenced by the much greater percentage of patients with a reduction of HCV RNA levels in the blood.

Table 6: Comparison of Viral Kinetic Assessments Among Placebo, SOC, ITMN-191 Monotherapy and Combination Therapy Following 14 Days of Treatment.

Group	N	Study Drug	Dose	Schedule	Total	(<43 IU/mL)[3] (%)
1	10	placebo	NA[1]	NA[1]	NA[1]	0/10 (0%)
2	12	SOC	NA[2]	NA[2]	NA[2]	0/10 (0%)
3	8	ITMN-191	100 mg	q8h	300 mg	1/8 (13%)
4	8	ITMN-191 and SOC	100 mg	q8h	300 mg	6/8 (75%)
5	8	ITMN-191	200 mg	q8h	600 mg	1/8 (13%)
6	8	ITMN-191 and SOC	200 mg	q8h	600 mg	7/8 (88%)

[1] NA = No Data: the placebo was given to two patients in each of the other patient groups in the monotherapy study
[2] NA = No Data: the SOC (pegylated interferon-alfa with ribavirin) was provided to two patients in each of the other patient groups in the combination therapy study
[3] HCV RNA measured after 14 days of treatment

Conclusion

[1160] The combination of ITMN-191 with SOC provides, on average, reduction of HCV RNA in all patient cohorts that is greater than SOC alone. The reduction of HCV RNA is observed without viral rebound.
