

URINAL

ABSTRACT

5 The present invention proposes a urinal wherein the bowl surface is formed by only the front face portion in an upper region which does not have any forwardly projecting plate-like side walls at opposite sides thereof, as in the conventional urinal, flush water clean a wider part of the bowl surface than in the prior art as well as reduce an area of the bowl surface that is not
10 cleaned and provide an improved cleanliness and sanitation of the bowl surface. The present invention provides a urinal (1) includes: a bowl surface (8) being arranged so as to situate between a line segment (16) connecting the left and right side edges (8b, 8c) and an arcuate segment (17) of a circle having a diameter corresponding to the line segment, as viewed in the
15 horizontal section through the flush water discharging device.
