

ABSTRACT

Signal Transmission System

5 A signal transmission system, for example a TDMA system, in
which a carrier is divided into a plurality of traffic signal time
slots, with optionally, some regularly interspersed control signal
time slots. In order to be able to provide flexibility in the
symbol rates and/or modulation schemes used by complementary users,
10 the traffic signal time slots have one of at least two
predetermined durations. However irrespective of the duration(s)
of the traffic signal time slots, the number of symbols per traffic
signal time slot remains substantially the same.
