

Apparatus and Process for Applying Two-Part Binding Adhesive to Pages at Printing

ABSTRACT

5 A binding process requires the application of respective parts of a two-part binding
adhesive as strips that could be at either side of a page to be bound. In one example, a stack
of pages are unstacked and conveyed individually along the path where part A of a two-part
adhesive is applied to one side of a page and Part B of the two-part adhesive is applied to
the reverse side of the page. A stack of pages with the respective parts of the two-part
10 adhesive applied to facing surfaces can then be pressed by a binding press so as to combine
the two parts of the adhesive which then set.
