

WASHING MACHINE

ABSTRACT OF THE DISCLOSURE

5

A washing machine according to the present disclosure includes: a liquid agent container (23) accommodated in an accommodating unit, included in the washing machine, configured to be pulled in and out of the accommodating unit; a liquid agent container cover (31) configured to cover the top face of the liquid agent container (23); and a water feeding unit hole through which water is fed into the liquid agent container (23) from above. The liquid agent container cover (31) includes: an opening (35) located below the water feeding unit hole when the liquid agent container (23) is accommodated in the accommodating unit; and a first rib (32) formed in the top face of the liquid agent container cover (31). The first rib (32) is disposed to cover the lower lateral side of the water feeding unit hole when the liquid agent container (23) is pulled out of the accommodating unit. With this configuration, the first rib (32) prevents water fed through the water feeding hole from flowing out to the lateral side of the liquid agent container cover (31) when the liquid agent container (23) is pulled out of the accommodating unit.
