

APPARATUS CHECKING METHOD AND APPARATUS TO WHICH THE SAME
IS APPLIED

ABSTRACT

In a method of checking an apparatus, failure time intervals of sections of an apparatus are divided into a plurality of failure time interval groups, each of which is indicated by a specific failure time interval. A plurality of check programs are classified into a plurality of groups (1 to 4) corresponding to the plurality of failure time interval groups based on the failure time interval of the section corresponding to each of the plurality of check programs. A group execution time interval of each of the plurality of groups (1 to 4) is determined based on the specific failure time interval. Then, each of the plurality of groups is executed based on the group execution time interval.
