

PACKING IMPLEMENT FOR GOODS TRANSPORTATION

Abstract

[Problem] To easily perform packing of an article to be stored.

[Solution] This is a combination of a baseboard 6 and a holding sheet 7. The baseboard 6 is a rectangular flat board, and has an article mounting surface 6a and rising parts 11 and falling parts 12 therearound. The falling parts 11 are parts that are folded back downward from both side edges of a long side of the article mounting surface, and the rising parts 12 are parts that are erected upward from both end edges of a short side of the article mounting surface. The holding sheet 7 covers the front surface of an article 1 mounted on the article mounting surface 6a of the baseboard 6 and presses the article 1 to the baseboard 6, and is stuck to a board surface of the baseboard 6 with tension in a direction to narrow the distance between both side edges of the long side applied to the baseboard 6, and the falling parts 11 at both sides of the long side applied with tension receive the tension of the holding sheet 7 to be erected upward, and form a gap between the holding sheet 7 and the board surface of the baseboard 6.
