ABSTRACT OF THE DISCLOSURE

In an electronic commercial transaction processing method and an apparatus for executing the method, an unauthorized user is prevented from ordering articles in an operation to purchase articles via a network. In embodiments thereof, a client device sends a specified URL to a server device and then receives a home page. The client device then displays a page to sell articles and transmits information of selected articles to the server device. When a page to confirm an order of articles is indicated, an URL thereof is read from an external storage medium and then the inputted URL and the information of selected articles are sent to the server device. Namely, any user who does not have an external storage medium in which the URL of the order confirmation page is stored is not allowed to order articles.
