MULTISPECIFIC FGF21 RECEPTOR AGONISTS AND THEIR USES

ABSTRACT OF THE DISCLOSURE

Multispecific binding molecules (MBMs) comprising at least three antigen binding sites that bind to FGR1c, the GH1 domain of Klotho beta ("KLB"), and the GH2 domain of KLB, pharmaceutical compositions containing the MBMs, methods of using the MBMs and pharmaceutical compositions for treating metabolic diseases, nucleic acids encoding the MBMs, cells engineered to express the MBMs, and methods of producing MBMs.
