COMPOSITIONS AND METHODS FOR TREATING AUTOIMMUNE DISEASES AND CANCERS BY TARGETING IGSF8

ABSTRACT:

The present invention provides methods and compositions for treating a cancer, and/or an autoimmune disepase, by modulating the expression and/or activity of IGSF8 and its binding ligands. The pharmaceutical compositions may include, but are not limited to, antibodies that specifically bind human IGSF8, and have an activity of inhibiting IGSF8-mediated immunosuppression in a subject in need thereof.
