

Abstract

Time-Domain Resource Information Indication Method and Apparatus

5 The present invention provides a time-domain resource information indication method
and apparatus. The method comprises: in a mobile communication system using multiple
subcarrier intervals, transmitting, based on preset subcarrier interval information, time-domain
resource indication information of a data channel. The preset subcarrier interval information
may comprise one of the multiple subcarrier intervals or is based on rules of the multiple
10 subcarrier intervals. For a system, such as a 5G NR, which uses multiple subcarrier intervals,
the present invention provides a mechanism for indicating, based on preset subcarrier interval
information, time-domain resource information of a data channel.
