

[ABSTRACT]

When a display part to be set as a similar part search target is selected from among a plurality of display parts displayed on a design screen 26, an operation of selecting an executing button 104 for a single-part search is performed on a recommender execution selecting screen 100, and an operation of selecting a YES button 112 is performed on a search execution confirmation screen 110, the model number of the one display part being selected is extracted, a server 4 is accessed via the Internet 5, and similar part search data including the extracted model number is transmitted. A CPU 21 of the server 4 refers to similar part data stored in a memory 22, and retrieves similar part model numbers associated with the extracted model number. The part data of the extracted model number and the part data of all of the retrieved similar part model numbers are transmitted from the server 4 to a user terminal 3. A single-part search result detailed screen 120 displaying the model numbers of the respective parts is displayed on a display 11.
