

Apparatus And Method For Determining A Location-Spoofing Application

Abstract

The present disclosure provides an apparatus and a method for determining a location-spoofing application, the method comprising: generating a numeric representation of an application name of an application used for generating a geolocation position signal of a user using a variable derived from a list of application names relating to a plurality of other applications capable of generating a geolocation position signal of a user; and determining a prediction on whether the application is a location-spoofing application based on a scale of the generated numeric representation of the application name.
