

[ABSTRACT]

Disclosed is a dart game device. The dart game device includes: a dart target part having a plurality of scoring areas; a network communication unit for transmitting first play-related data of the dart game device participating in a play session that imposes play time constraints on two or more devices and receiving second play-related data of the other device participating in the play session; and a display unit for displaying information related to the play session based on the second play-related data. A representative drawing is FIG. 13.
