Abstract

Disclosed is a connector apparatus for receiving a card-like data processing medium in a frame element having a rear transverse element and a pair of longitudinal elements. A header is disposed adjacent the rear element of the frame member and .
5 an actuator bar for moving the card-like data processing medium out of engagement with the header is provided. An eject plate is moved by a link arm connected to the frame at a pivot point. The actuator bar is positioned below or above one of the longitudinal elements of the frame to significantly reduce the transverse dimension of the connector.
