

AIR CONDITIONER

This Sheet Has Been Replaced

ABSTRACT

The present invention discloses an air conditioner (12) for exchanging heat from a refrigerant to the outside and adjusting at least one of room temperature and humidity to a desired room temperature and humidity. The air conditioner (12) has a 1/f fluctuation function for controlling an air supplying means (112A, 112B) for supplying conditioned air in multiple levels. An air amount designating means (300) designates a reference air amount of the air supplying means (112A, 112B), an air amount control means (308) controls the air supplying means (112A, 112B) corresponding to the designated reference air amount and a fluctuation width designating means (304) designates a fluctuation width (amplitude of the air amount) corresponding to the designated air amount.
