

(57) Abstract: A device to provide a seal between a housing(11) for a moving element (10) such as a drill chain, piston or the like and the moving element. The device comprising a storage well (13) to retain seal material, the storage well having an outlet connecting with an aperture in a housing enabling seal material to flow into the space between a housing and the moving element and form a seal, the device further including an inlet port (16) enabling seal material precursor to be added into the storage well, new-line pressurising means to pressurise the seal material precursor and force it out of the aperture.
