

METHODS, APPARATUSES, DEVICES, AND MEDIA FOR DATA PROCESSING, RESOURCE TRANSFER, AND PAYMENT

ABSTRACT

5 Embodiments of the present specification disclose a data processing method,
including the following: obtaining a user binding request, determining a first
to-be-bound account on a first server, and sending user binding request feedback data
so that a terminal device displays candidate binding objects; obtaining binding object
selection data, determining respective target binding objects, and determining a target
10 server among the servers corresponding to each of the respective target binding
objects; and binding the first account to a second account on each target server, and
sending an account binding request to each target server so that the target server binds
the second account to the first account, where the second account corresponds to the
same user identity data as the first account.
