

ABSTRACT

MOBILE TERMINAL APPARATUS, INFORMATION OUTPUT SYSTEM, INFORMATION OUTPUT METHOD AND RECORDING MEDIUM

The invention relates to an information output system. A DLNA server, if any folder name includes a date or an event name, registers, as publication files, the files included in a detected folder with a DB in date ascending order, and, if any folder name includes neither any date nor any event name, registers, as publication files, the files included in a detected folder with the DB in date descending order. When a first communication section (24) receives, from a DLNA client, a folder information request of a folder name selected by a remote controller (38), a content list, which is a list of the file names of the files included in the folder of the selected folder name, is created, and the created content list is then transmitted by the first communication section (24) to the DLNA client.
