(54) Title: COMPUTER-BASED BODY PART ANALYSIS METHODS AND SYSTEMS

Fig. 2

(57) Abstract: The present invention provides methods for determining a personal improvement potential of physiological characteristics of human faces or other body parts. This may involve determining an objective score of at least one physiological characteristic, in particular an attractiveness and/or youthfulness score, of the face of a human user. More specifically, the invention provides a computer-implemented body part analysis method. The method may comprise an image acquisition step, comprising obtaining one or more digital images of at least one body part of a user, in particular the user's face, captured by an image capturing device. The method may further comprise an image processing step, comprising detecting one or more biometric parameters of the at least one body part in the captured one or more digital images. Still further, the method may comprise an evaluation step, comprising determining a score for each of one or more physiological characteristics of the at least one body part based on the detected one or more biometric parameters.
