

ABSTRACT

The present invention relates to a set of sterilizing electrodes, to a set of sterilizing electrodes, method of sterilizing and sterilization apparatus using same, comprising: a conductive body formed of electrically conductive material and having
5 a facing surface and connected to power supply; an electrode catalyst layer stacked on the facing surface of the conductive body; and, an insulation cover formed of an insulating material, and is fixed to the conductive body with the electrode catalyst layer interposed between the conductive body, wherein through portions are provided to form a first region that is a exposed part of the electrode catalyst layer through the
10 through portions at a plurality of positions, and wherein the remaining areas of the electrode catalyst layer other than the first region are covered by the insulation cover; thereby obtaining advantageous effects that it is easy to manufacture to replace and to recycle the electrode catalyst layer, and also sterilizing components can be uniformly and effectively generated.
