

ABSTRACT

SERVICE ARCHITECTURE SUPPORT METHOD AND SYSTEM FOR
MEDICAL/NURSING SUPPORT SYSTEM

Provided is a service architecture support method with which the content of a new service provided by an application incorporated into a medical/nursing support system can be finely adjusted according to the needs of a patient or a person requiring care, or a medical professional or a nurse. To that end, when an application (220) developed using an application framework (200) is incorporated into a medical/nursing support system (30), an application ID is allocated to the application (220) and the application ID is associated with a group ID and stored, thereby enabling selective use of a new service provided by the application (220) by only a group member of a group with which the application ID has been associated. Furthermore, the specific function installed in the application (220) can be set in administrator settings according to the needs of a patient or a medical professional from said group.
