SLOT MACHINE AND CONTROL METHOD OF GAME

ABSTRACT OF THE DISCLOSURE

A slot machine of the present invention comprises: a symbol display device capable of variably displaying a plurality of symbols; and a controller, the controller programmed to execute the processing of: (A) executing a game in which the plurality of symbols are variably displayed and then stop-displayed to the symbol display device after game media are BET in number equal to or less than a previously set maximum number of BETs, and game media are paid out in number according to the plurality of stop-displayed symbols; (B) shifting a mode from a non-insurance mode to an insurance mode on condition that a predetermined number of game media is inserted; (C) counting the number of games played after shifting to the insurance mode, in the insurance mode; (D) paying out a predetermined number of game media when the number of games counted in the processing (C) reaches a specific number; and (E) shifting the mode from the insurance mode to the non-insurance mode while holding the number of games counted by the processing (C) when a predetermined insurance canceling condition is established.
