

BENZOTHIOPHENE DERIVATIVES AND COMPOSITIONS THEREOF AS SELECTIVE ESTROGEN RECEPTOR DEGRADERS

BACKGROUND

FIELD OF THE INVENTION

[0001] The present invention relates to compounds and compositions that are potent antagonists of estrogen receptor signaling and selective estrogen receptor degraders (SERDs). The invention further provides a process for the preparation of compounds of the invention, pharmaceutical preparations comprising such compounds and methods of using such compounds and compositions in the management of diseases or disorders associated with aberrant estrogen receptor activity.

BACKGROUND OF THE INVENTION

[0002] Estrogens play a critical role in the development of female and male reproductive tissues and contribute to the development and progression of estrogen receptor diseases or disorders such as breast, ovarian, colon, prostate, endometrial and uterine cancers. Estrogen receptor (ER α)-positive diseases such as breast cancer are usually treated with a selective estrogen receptor modulator (SERM) or an aromatase inhibitor (AI). While these therapies have proven effective at reducing the incidence of progression of breast cancer, some patients exhibit treatment resistance and progress to advanced metastatic breast cancer.

[0003] Treatment resistance results, in part, from the evolution of tumors to a state of hypersensitivity to low estrogen levels (AI treatment) or development of dependence upon the antiestrogen for activation of transcription (SERM treatment). SERDs degrade the receptor, effectively eliminating ER α expression and in so doing circumvent the underlying mechanisms of resistance that develop to antiendocrine monotherapy. Further, clinical and preclinical data show that a significant number of the resistance pathways can be circumvented by the use of an antiestrogen that exhibits SERD activity.

[0004] The compounds of the present invention, as SERDs, can be used as therapies for the treatment of estrogen receptor diseases or disorders, for example, ovulatory dysfunction, uterine cancer, endometrium cancer, ovarian cancer, endometriosis, osteoporosis, prostate cancer, benign prostatic hypertrophy, estrogen receptor (ER α)-positive breast cancer, in particular ER α -positive breast cancer exhibiting *de novo* resistance to existing anti-estrogens and aromatase inhibitors.

Definitions

[0022] The general terms used hereinbefore and hereinafter preferably have within the context of this disclosure the following meanings, unless otherwise indicated, where more general

terms wherever used may, independently of each other, be replaced by more specific definitions or remain, thus defining more detailed embodiments of the invention:

[0023] “Alkyl” refers to a fully saturated branched or unbranched hydrocarbon moiety having up to 20 carbon atoms. Unless otherwise provided, alkyl refers to hydrocarbon moieties having 1 to 7 carbon atoms (C₁₋₇alkyl), or 1 to 4 carbon atoms (C₁₋₄alkyl). Representative examples of alkyl include, but are not limited to, methyl, ethyl, *n*-propyl, *iso*-propyl, *n*-butyl, *sec*-butyl, *iso*-butyl, *tert*-butyl, *n*-pentyl, isopentyl, neopentyl, *n*-hexyl, 3-methylhexyl, 2,2-dimethylpentyl, 2,3-dimethylpentyl, *n*-heptyl, *n*-octyl, *n*-nonyl, *n*-decyl and the like. A substituted alkyl is an alkyl group containing one or more, such as one, two or three substituents selected from halogen, hydroxy or alkoxy groups. Halo-substituted-alkyl and halo-substituted-alkoxy, can be either straight-chained or branched and includes, methoxy, ethoxy, difluoromethyl, trifluoromethyl, pentafluoroethyl, difluoromethoxy, trifluoromethoxy, and the like.

[0024] “Aryl” means a monocyclic or fused bicyclic aromatic ring assembly containing six to ten ring carbon atoms. For example, aryl may be phenyl or naphthyl, preferably phenyl. “Arylene” means a divalent radical derived from an aryl group.

[0025] “Heteroaryl” is as defined for aryl above where one or more of the ring members is a heteroatom. For example C₅₋₁₀heteroaryl is a minimum of 5 members as indicated by the carbon atoms but that these carbon atoms can be replaced by a heteroatom. Consequently, C₅₋₁₀heteroaryl includes pyridyl, indolyl, indazolyl, quinoxaliny, quinoliny, benzofuranyl, benzopyranyl, benzothiopyranyl, benzo[1,3]dioxole, imidazolyl, benzo-imidazolyl, pyrimidinyl, furanyl, oxazolyl, isoxazolyl, triazolyl, tetrazolyl, pyrazolyl, thienyl, etc.

[0026] “Cycloalkyl” means a saturated or partially unsaturated, monocyclic, fused bicyclic or bridged polycyclic ring assembly containing the number of ring atoms indicated. For example, C₃₋₁₀cycloalkyl includes cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, etc.

[0027] “Heterocycloalkyl” means cycloalkyl, as defined in this application, provided that one or more of the ring carbons indicated, are replaced by a moiety selected from -O-, -N=, -NR-, -C(O)-, -S-, -S(O)- or -S(O)₂-, wherein R is hydrogen, C₁₋₄alkyl or a nitrogen protecting group. For example, C₃₋₈heterocycloalkyl as used in this application to describe compounds of the invention includes morpholino, pyrrolidinyl, pyrrolidinyl-2-one,

piperazinyl, piperidinyl, piperidinylone, 1,4-dioxo-8-aza-spiro[4.5]dec-8-yl, thiomorpholino, sulfanomorpholino, sulfonomorpholino, etc.

[0028] “Halogen” (or halo) preferably represents chloro or fluoro, but may also be bromo or iodo.

[0029] Compounds of formula I may have different isomeric forms. For example, any asymmetric carbon atom may be present in the (R)-, (S)- or (R,S)-configuration, preferably in the (R)- or (S)-configuration. Substituents at a double bond or especially a ring may be present in cis- (= Z-) or trans (= E-) form. The compounds may thus be present as mixtures of isomers or preferably as pure isomers, preferably as pure diastereomers or pure enantiomers.

[0030] Compounds of formula I have X defined as being selected from O and NR₆; wherein R₆ is C₁₋₄alkyl. It is known that other groups such as a bond or carbonyl at the X position is detrimental to the antagonist activity (IC₅₀ MCF7 μM) and degradation potential (ER percentage remaining) of the compounds. Compare the following:

Structure			
IC ₅₀ MCF7 μM	0.748	>10	>10
ER Percentage remaining	41	76	60

[0031] Compounds of formula I have R₃ defined as being selected from -CH₂CH₂R_{8b} and -CR_{8a}=CR_{8b}R_{8b}. It is known that, for example where each R_{8a} and R_{8b} is hydrogen, a shorter or longer bond order between the phenyl and -C(O)OH is detrimental to the antagonist activity (IC₅₀ MCF7 μM) and degradation potential (ER percentage remaining) of the compounds. Compare the following:

Structure			
SERD IC ₅₀ MCF7 μ M	0.748	10	10
ER Percentage remaining	41	57	55

[0032] Where the plural form (e.g. compounds, salts) is used, this includes the singular (e.g. a single compound, a single salt). “A compound” does not exclude that (e.g. in a pharmaceutical formulation) more than one compound of the formula I (or a salt thereof) is present, the “a” merely representing the indefinite article. “A” can thus preferably be read as “one or more”, less preferably alternatively as “one”.

[0033] Wherever a compound or compounds of the formula I are mentioned, this is further also intended to include N-oxides of such compounds and/or tautomers thereof.

[0034] The term “and/or an N-oxide thereof, a tautomer thereof and/or a (preferably pharmaceutically acceptable) salt thereof” especially means that a compound of the formula I may be present as such or in mixture with its N-oxide, as tautomer (e.g. due to keto-enol, lactam-lactim, amide-imidic acid or enamine-imine tautomerism) or in (e.g. equivalency reaction caused) mixture with its tautomer, or as a salt of the compound of the formula I and/or any of these forms or mixtures of two or more of such forms.

[0035] The present invention also includes all suitable isotopic variations of the compounds of the invention, or pharmaceutically acceptable salts thereof. An isotopic variation of a compound of the invention or a pharmaceutically acceptable salt thereof is defined as one in which at least one atom is replaced by an atom having the same atomic number but an atomic mass different from the atomic mass usually found in nature. Examples of isotopes that may be incorporated into the compounds of the invention and pharmaceutically acceptable salts thereof

include, but are not limited to, isotopes of hydrogen, carbon, nitrogen and oxygen such as ^2H , ^3H , ^{11}C , ^{13}C , ^{14}C , ^{15}N , ^{17}O , ^{18}O , ^{35}S , ^{18}F , ^{36}Cl and ^{123}I . Certain isotopic variations of the compounds of the invention and pharmaceutically acceptable salts thereof, for example, those in which a radioactive isotope such as ^3H or ^{14}C is incorporated, are useful in drug and/or substrate tissue distribution studies. In particular examples, ^3H and ^{14}C isotopes may be used for their ease of preparation and detectability. In other examples, substitution with isotopes such as ^2H may afford certain therapeutic advantages resulting from greater metabolic stability, such as increased in vivo half-life or reduced dosage requirements. Isotopic variations of the compounds of the invention or pharmaceutically acceptable salts thereof can generally be prepared by conventional procedures using appropriate isotopic variations of suitable reagents. For example, compounds of the invention can exist in a deuterated form as shown below:

Pharmacology and Utility

[0050] The present invention relates to compounds of Formula I that diminish the effects of estrogen receptors and lower the concentrations of estrogen receptors, and therefore, are useful as agents for the treatment or prevention of diseases or conditions in which the actions of estrogens or estrogen receptors are involved in the etiology or pathology of the disease or condition or contribute to at least one symptom of the disease or condition and wherein such

actions of estrogens or estrogen receptors are undesirable. Compounds of the invention are both potent estrogen receptor antagonists and selective estrogen receptor degraders (SERDS).

[0051] The estrogen receptor (ER) is a ligand-activated transcription factor that belongs to the nuclear hormone receptor superfamily. In both females and males, estrogens play an important role in the regulation of a number of physiological processes. In humans, two different ER subtypes are known: ER α and ER β . Each subtype has a distinct tissue distribution and with different biological roles. For example, ER α has high presence in endometrium, breast cancer cells, ovarian stroma cells and in the hypothalamus. The expression of the ER β protein has been documented in kidney, brain, bone, heart, lungs, intestinal mucosa, prostate, bladder, ovary, testis, and endothelial cells.

[0052] Pharmaceuticals such as tamoxifen, raloxifene and lasofoxifene are well known estrogen receptor modulators. Tamoxifen, for example, behaves like an estrogen in bone and endometrium, whereas it behaves like an anti-estrogen in breast tissue. Breast cancer is the predominant neoplastic disease in women. ER α is a major driver of breast cancer progression. Multiple existing treatment approaches aim to reduce estrogen levels or block its binding to ER α thereby minimizing tumor progression or even inducing tumor regression in ER α -positive breast cancer. Tamoxifen is a first-generation treatment for ER α -positive breast cancer. However, efficacy in breast cancer treatment is seriously compromised by intrinsic or newly developed resistance to anti-hormonal therapy such as treatment with tamoxifen or aromatase inhibitors. Such resistance can exist or develop as a result of ER α phosphorylation or regulation of key components in hormone receptor and/or growth factor signal transduction pathways. Tamoxifen resistance is driven by the residual agonist activity of tamoxifen. Second generation treatments such as toremifene, droloxifene, idoxifene, arzoxifene, and raloxifene have failed to improve upon the efficacy of tamoxifen in the treatment of ER α -positive breast cancer and/or demonstrated cross-resistance with each other.

[0053] Fulvestrant is a pure ER α antagonist without the partial agonist activity which is typical for the estrogen receptor modulators. It is the only marketed selective estrogen receptor degrader (SERD) and it is efficacious in second-line treatment of breast cancer. Fulvestrant both antagonizes estrogen receptors and effectively degrades or down-regulates ER α protein levels in cells. This SERD activity inhibits ER α -driven proliferation and tumor growth. Fulvestrant, when

administered once a month at 250 mg is equally effective to tamoxifen in treatment of ER α -positive advanced breast cancer. In second-line treatment of ER α -positive tamoxifen-resistant breast cancer, fulvestrant, when administered once a month at 250 mg, is equally effective to aromatase inhibitors, despite relatively poor bioavailability and/or target exposure which limits its clinical efficacy. A number of other SERDs exist, for example: "ICI 164,384", a structural analog of fulvestrant; "GW5638", a structural analog of tamoxifen; and "GW7604", a structural analogue of 4-hydroxy-tamoxifen.

[0054] Hence, there is a need for new, potent ER α antagonists, which would preferably have ER degrading or down-regulating activity in, for example, breast cancer cells without stimulating proliferation in ER α -positive, hormone treatment-resistant breast cancer cells. Such compounds would be orally administrable and be useful in the treatment of, amongst other things, ER α -positive, hormone treatment-resistant breast cancer.

[0055] Estrogen receptor-related diseases or conditions include, but are not limited to, aberrant estrogen receptor activity associated with: cancer, for example, bone cancer, breast cancer, colorectal cancer, endometrial cancer, prostate cancer, ovarian and uterine cancer; leiomyoma, for example, uterine leiomyoma; central nervous system defects, for example, alcoholism and migraine; cardiovascular system defects, for example, aortic aneurysm, susceptibility to myocardial infarction, aortic valve sclerosis, cardiovascular disease, coronary artery disease and hypertension; hematological system defects, for example, deep vein thrombosis; immune and inflammation diseases, for example, Graves' Disease, arthritis, multiple sclerosis and cirrhosis; susceptibility to infection, for example, hepatitis B and chronic liver disease; metabolic defects, for example, bone density, cholestasis, hypospadias, obesity, osteoarthritis, osteopenia and osteoporosis; neurological defects, for example, Alzheimer's disease, Parkinson's disease, migraine and vertigo; psychiatric defects, for example, anorexia nervosa, attention deficit hyperactivity disorder, dementia, major depressive disorder and psychosis; and reproductive defects, for example, age of menarche, endometriosis and infertility. In the context of treating cancers, the compound of Formula I offer improved therapeutic activity characterized by complete or longer-lasting tumor regression, a lower incidence or rate of development of resistance to treatment, and/or a reduction in tumor invasiveness.

[0056] The present invention relates to compounds that are both potent estrogen receptor antagonists and selective estrogen receptor degraders. The invention further provides a process for the preparation of compounds of the invention and pharmaceutical preparations comprising such compounds. Another aspect of the present invention relates to a method of treating disorders mediated by estrogen receptors comprising the step of administering to a patient in need thereof a therapeutically effective amount of a compound of formula I as defined in the Summary of the Invention

Pharmaceutical Compositions

[0085] In another aspect, the present invention provides pharmaceutically acceptable compositions which comprise a therapeutically-effective amount of one or more of the compounds described above, formulated together with one or more pharmaceutically acceptable carriers (additives) and/or diluents. As described in detail below, the pharmaceutical compositions of the present invention may be specially formulated for administration in solid or liquid form, including those adapted for the following: (1) oral administration, for example, drenches (aqueous or non-aqueous solutions or suspensions), tablets, e.g., those targeted for buccal, sublingual, and systemic absorption, boluses, powders, granules, pastes for application to the tongue; (2) parenteral administration, for example, by subcutaneous, intramuscular, intravenous or epidural injection as, for example, a sterile solution or suspension, or sustained-release formulation; (3) topical application, for example, as a cream, ointment, or a controlled-release patch or spray applied to the skin; (4) intravaginally or intrarectally, for example, as a pessary, cream or foam; (5) sublingually; (6) ocularly; (7) transdermally; (8) nasally; (9) pulmonary; or (10) intrathecally.

[0086] The phrase "therapeutically-effective amount" as used herein means that amount of a compound, material, or composition comprising a compound of the present invention

which is effective for producing some desired therapeutic effect in at least a sub-population of cells in an animal at a reasonable benefit/risk ratio applicable to any medical treatment.

[0087] The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

[0088] The phrase "pharmaceutically-acceptable carrier" as used herein means a pharmaceutically-acceptable material, composition or vehicle, such as a liquid or solid filler, diluent, excipient, manufacturing aid (e.g., lubricant, talc magnesium, calcium or zinc stearate, or steric acid), or solvent encapsulating material, involved in carrying or transporting the subject compound from one organ, or portion of the body, to another organ, or portion of the body. Each carrier must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not injurious to the patient. Some examples of materials which can serve as pharmaceutically-acceptable carriers include: (1) sugars, such as lactose, glucose and sucrose; (2) starches, such as corn starch and potato starch; (3) cellulose, and its derivatives, such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; (4) powdered tragacanth; (5) malt; (6) gelatin; (7) talc; (8) excipients, such as cocoa butter and suppository waxes; (9) oils, such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; (10) glycols, such as propylene glycol; (11) polyols, such as glycerin, sorbitol, mannitol and polyethylene glycol; (12) esters, such as ethyl oleate and ethyl laurate; (13) agar; (14) buffering agents, such as magnesium hydroxide and aluminum hydroxide; (15) alginic acid; (16) pyrogen-free water; (17) isotonic saline; (18) Ringer's solution; (19) ethyl alcohol; (20) pH buffered solutions; (21) polyesters, polycarbonates and/or polyanhydrides; and (22) other non-toxic compatible substances employed in pharmaceutical formulations.

[0089] As set out above, certain embodiments of the present compounds may contain a basic functional group, such as amino or alkylamino, and are, thus, capable of forming pharmaceutically-acceptable salts with pharmaceutically-acceptable acids. The term "pharmaceutically-acceptable salts" in this respect, refers to the relatively non-toxic, inorganic and organic acid addition salts of compounds of the present invention. These salts can be prepared *in*

situ in the administration vehicle or the dosage form manufacturing process, or by separately reacting a purified compound of the invention in its free base form with a suitable organic or inorganic acid, and isolating the salt thus formed during subsequent purification. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, phosphate, nitrate, acetate, valerate, oleate, palmitate, stearate, laurate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphthylate, mesylate, glucoheptonate, lactobionate, and laurylsulphonate salts and the like. (See, for example, Berge et al. (1977) "Pharmaceutical Salts", *J. Pharm. Sci.* 66:1-19).

[0090] The pharmaceutically acceptable salts of the subject compounds include the conventional nontoxic salts or quaternary ammonium salts of the compounds, e.g., from non-toxic organic or inorganic acids. For example, such conventional nontoxic salts include those derived from inorganic acids such as hydrochloride, hydrobromic, sulfuric, sulfamic, phosphoric, nitric, and the like; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, palmitic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, isothionic, and the like.

[0091] In other cases, the compounds of the present invention may contain one or more acidic functional groups and, thus, are capable of forming pharmaceutically-acceptable salts with pharmaceutically-acceptable bases. The term "pharmaceutically-acceptable salts" in these instances refers to the relatively non-toxic, inorganic and organic base addition salts of compounds of the present invention. These salts can likewise be prepared *in situ* in the administration vehicle or the dosage form manufacturing process, or by separately reacting the purified compound in its free acid form with a suitable base, such as the hydroxide, carbonate or bicarbonate of a pharmaceutically-acceptable metal cation, with ammonia, or with a pharmaceutically-acceptable organic primary, secondary or tertiary amine. Representative alkali or alkaline earth salts include the lithium, sodium, potassium, calcium, magnesium, and aluminum salts and the like. Representative organic amines useful for the formation of base addition salts include ethylamine, diethylamine, ethylenediamine, ethanolamine, diethanolamine, piperazine and the like. (See, for example, Berge et al., *supra*)

[0092] Wetting agents, emulsifiers and lubricants, such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, release agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the compositions.

[0093] Examples of pharmaceutically-acceptable antioxidants include: (1) water soluble antioxidants, such as ascorbic acid, cysteine hydrochloride, sodium bisulfate, sodium metabisulfite, sodium sulfite and the like; (2) oil-soluble antioxidants, such as ascorbyl palmitate, butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT), lecithin, propyl gallate, alpha-tocopherol, and the like; and (3) metal chelating agents, such as citric acid, ethylenediamine tetraacetic acid (EDTA), sorbitol, tartaric acid, phosphoric acid, and the like.

[0094] Formulations of the present invention include those suitable for oral, nasal, topical (including buccal and sublingual), rectal, vaginal and/or parenteral administration. The formulations may conveniently be presented in unit dosage form and may be prepared by any methods well known in the art of pharmacy. The amount of active ingredient which can be combined with a carrier material to produce a single dosage form will vary depending upon the host being treated, the particular mode of administration. The amount of active ingredient which can be combined with a carrier material to produce a single dosage form will generally be that amount of the compound which produces a therapeutic effect. Generally, out of one hundred per cent, this amount will range from about 0.1 per cent to about ninety-nine percent of active ingredient, preferably from about 5 per cent to about 70 per cent, most preferably from about 10 percent to about 30 percent.

[0095] In certain embodiments, a formulation of the present invention comprises an excipient selected from the group consisting of cyclodextrins, celluloses, liposomes, micelle forming agents, e.g., bile acids, and polymeric carriers, e.g., polyesters and polyanhydrides; and a compound of the present invention. In certain embodiments, an aforementioned formulation renders orally bioavailable a compound of the present invention.

[0096] Methods of preparing these formulations or compositions include the step of bringing into association a compound of the present invention with the carrier and, optionally, one or more accessory ingredients. In general, the formulations are prepared by uniformly and

intimately bringing into association a compound of the present invention with liquid carriers, or finely divided solid carriers, or both, and then, if necessary, shaping the product.

[0097] Formulations of the invention suitable for oral administration may be in the form of capsules, cachets, pills, tablets, lozenges (using a flavored basis, usually sucrose and acacia or tragacanth), powders, granules, or as a solution or a suspension in an aqueous or non-aqueous liquid, or as an oil-in-water or water-in-oil liquid emulsion, or as an elixir or syrup, or as pastilles (using an inert base, such as gelatin and glycerin, or sucrose and acacia) and/or as mouth washes and the like, each containing a predetermined amount of a compound of the present invention as an active ingredient. A compound of the present invention may also be administered as a bolus, electuary or paste.

[0098] In solid dosage forms of the invention for oral administration (capsules, tablets, pills, dragees, powders, granules, trouches and the like), the active ingredient is mixed with one or more pharmaceutically-acceptable carriers, such as sodium citrate or dicalcium phosphate, and/or any of the following: (1) fillers or extenders, such as starches, lactose, sucrose, glucose, mannitol, and/or silicic acid; (2) binders, such as, for example, carboxymethylcellulose, alginates, gelatin, polyvinyl pyrrolidone, sucrose and/or acacia; (3) humectants, such as glycerol; (4) disintegrating agents, such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate; (5) solution retarding agents, such as paraffin; (6) absorption accelerators, such as quaternary ammonium compounds and surfactants, such as poloxamer and sodium lauryl sulfate; (7) wetting agents, such as, for example, cetyl alcohol, glycerol monostearate, and non-ionic surfactants; (8) absorbents, such as kaolin and bentonite clay; (9) lubricants, such as talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, zinc stearate, sodium stearate, stearic acid, and mixtures thereof; (10) coloring agents; and (11) controlled release agents such as crospovidone or ethyl cellulose. In the case of capsules, tablets and pills, the pharmaceutical compositions may also comprise buffering agents. Solid compositions of a similar type may also be employed as fillers in soft and hard-shelled gelatin capsules using such excipients as lactose or milk sugars, as well as high molecular weight polyethylene glycols and the like.

[0099] A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared using binder (for example, gelatin or

hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (for example, sodium starch glycolate or cross-linked sodium carboxymethyl cellulose), surface-active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent.

[00100] The tablets, and other solid dosage forms of the pharmaceutical compositions of the present invention, such as dragees, capsules, pills and granules, may optionally be scored or prepared with coatings and shells, such as enteric coatings and other coatings well known in the pharmaceutical-formulating art. They may also be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethyl cellulose in varying proportions to provide the desired release profile, other polymer matrices, liposomes and/or microspheres. They may be formulated for rapid release, e.g., freeze-dried. They may be sterilized by, for example, filtration through a bacteria-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved in sterile water, or some other sterile injectable medium immediately before use. These compositions may also optionally contain opacifying agents and may be of a composition that they release the active ingredient(s) only, or preferentially, in a certain portion of the gastrointestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes. The active ingredient can also be in micro-encapsulated form, if appropriate, with one or more of the above-described excipients.

[00101] Liquid dosage forms for oral administration of the compounds of the invention include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs. In addition to the active ingredient, the liquid dosage forms may contain inert diluents commonly used in the art, such as, for example, water or other solvents, solubilizing agents and emulsifiers, such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor and sesame oils), glycerol, tetrahydrofuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

[00102] Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, coloring, perfuming and preservative agents.

[00103] Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar and tragacanth, and mixtures thereof.

[00104] Formulations of the pharmaceutical compositions of the invention for rectal or vaginal administration may be presented as a suppository, which may be prepared by mixing one or more compounds of the invention with one or more suitable nonirritating excipients or carriers comprising, for example, cocoa butter, polyethylene glycol, a suppository wax or a salicylate, and which is solid at room temperature, but liquid at body temperature and, therefore, will melt in the rectum or vaginal cavity and release the active compound.

[00105] Formulations of the present invention which are suitable for vaginal administration also include pessaries, tampons, creams, gels, pastes, foams or spray formulations containing such carriers as are known in the art to be appropriate.

[00106] Dosage forms for the topical or transdermal administration of a compound of this invention include powders, sprays, ointments, pastes, creams, lotions, gels, solutions, patches and inhalants. The active compound may be mixed under sterile conditions with a pharmaceutically-acceptable carrier, and with any preservatives, buffers, or propellants which may be required.

[00107] The ointments, pastes, creams and gels may contain, in addition to an active compound of this invention, excipients, such as animal and vegetable fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives, polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or mixtures thereof.

[00108] Powders and sprays can contain, in addition to a compound of this invention, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants, such as chlorofluorohydrocarbons and volatile unsubstituted hydrocarbons, such as butane and propane.

[00109] Transdermal patches have the added advantage of providing controlled delivery of a compound of the present invention to the body. Such dosage forms can be made by dissolving or dispersing the compound in the proper medium. Absorption enhancers can also be

used to increase the flux of the compound across the skin. The rate of such flux can be controlled by either providing a rate controlling membrane or dispersing the compound in a polymer matrix or gel.

[00110] Ophthalmic formulations, eye ointments, powders, solutions and the like, are also contemplated as being within the scope of this invention.

[00111] Pharmaceutical compositions of this invention suitable for parenteral administration comprise one or more compounds of the invention in combination with one or more pharmaceutically-acceptable sterile isotonic aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, or sterile powders which may be reconstituted into sterile injectable solutions or dispersions just prior to use, which may contain sugars, alcohols, antioxidants, buffers, bacteriostats, solutes which render the formulation isotonic with the blood of the intended recipient or suspending or thickening agents.

[00112] Examples of suitable aqueous and nonaqueous carriers which may be employed in the pharmaceutical compositions of the invention include water, ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof, vegetable oils, such as olive oil, and injectable organic esters, such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials, such as lecithin, by the maintenance of the required particle size in the case of dispersions, and by the use of surfactants.

[00113] These compositions may also contain adjuvants such as preservatives, wetting agents, emulsifying agents and dispersing agents. Prevention of the action of microorganisms upon the subject compounds may be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid, and the like. It may also be desirable to include isotonic agents, such as sugars, sodium chloride, and the like into the compositions. In addition, prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

[00114] In some cases, in order to prolong the effect of a drug, it is desirable to slow the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material having poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in

turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally-administered drug form is accomplished by dissolving or suspending the drug in an oil vehicle.

[00115] Injectable depot forms are made by forming microencapsule matrices of the subject compounds in biodegradable polymers such as polylactide-polyglycolide. Depending on the ratio of drug to polymer, and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are compatible with body tissue.

[00116] When the compounds of the present invention are administered as pharmaceuticals, to humans and animals, they can be given per se or as a pharmaceutical composition containing, for example, 0.1 to 99% (more preferably, 10 to 30%) of active ingredient in combination with a pharmaceutically acceptable carrier.

[00117] The preparations of the present invention may be given orally, parenterally, topically, or rectally. They are of course given in forms suitable for each administration route. For example, they are administered in tablets or capsule form, by injection, inhalation, eye lotion, ointment, suppository, etc. administration by injection, infusion or inhalation; topical by lotion or ointment; and rectal by suppositories. Oral administrations are preferred.

[00118] The phrases "parenteral administration" and "administered parenterally" as used herein means modes of administration other than enteral and topical administration, usually by injection, and includes, without limitation, intravenous, intramuscular, intraarterial, intrathecal, intracapsular, intraorbital, intracardiac, intradermal, intraperitoneal, transtracheal, subcutaneous, subcuticular, intraarticular, subcapsular, subarachnoid, intraspinal and intrasternal injection and infusion.

[00119] The phrases "systemic administration," "administered systemically," "peripheral administration" and "administered peripherally" as used herein mean the administration of a compound, drug or other material other than directly into the central nervous system, such that it enters the patient's system and, thus, is subject to metabolism and other like processes, for example, subcutaneous administration.

[00120] These compounds may be administered to humans and other animals for therapy by any suitable route of administration, including orally, nasally, as by, for example, a spray, rectally, intravaginally, parenterally, intracisternally and topically, as by powders, ointments or drops, including buccally and sublingually.

[00121] Regardless of the route of administration selected, the compounds of the present invention, which may be used in a suitable hydrated form, and/or the pharmaceutical compositions of the present invention, are formulated into pharmaceutically-acceptable dosage forms by conventional methods known to those of skill in the art.

[00122] Actual dosage levels of the active ingredients in the pharmaceutical compositions of this invention may be varied so as to obtain an amount of the active ingredient which is effective to achieve the desired therapeutic response for a particular patient, composition, and mode of administration, without being toxic to the patient.

[00123] The selected dosage level will depend upon a variety of factors including the activity of the particular compound of the present invention employed, or the ester, salt or amide thereof, the route of administration, the time of administration, the rate of excretion or metabolism of the particular compound being employed, the rate and extent of absorption, the duration of the treatment, other drugs, compounds and/or materials used in combination with the particular compound employed, the age, sex, weight, condition, general health and prior medical history of the patient being treated, and like factors well known in the medical arts.

[00124] A physician or veterinarian having ordinary skill in the art can readily determine and prescribe the effective amount of the pharmaceutical composition required. For example, the physician or veterinarian could start doses of the compounds of the invention employed in the pharmaceutical composition at levels lower than that required in order to achieve the desired therapeutic effect and gradually increase the dosage until the desired effect is achieved.

[00125] In general, a suitable daily dose of a compound of the invention will be that amount of the compound which is the lowest dose effective to produce a therapeutic effect. Such an effective dose will generally depend upon the factors described above. Generally, oral, intravenous, intracerebroventricular and subcutaneous doses of the compounds of this invention

for a patient, when used for the indicated analgesic effects, will range from about 0.0001 to about 100 mg per kilogram of body weight per day.

[00126] If desired, the effective daily dose of the active compound may be administered as two, three, four, five, six or more sub-doses administered separately at appropriate intervals throughout the day, optionally, in unit dosage forms. Preferred dosing is one administration per day.

[00127] While it is possible for a compound of the present invention to be administered alone, it is preferable to administer the compound as a pharmaceutical formulation (composition).

[00128] The compounds according to the invention may be formulated for administration in any convenient way for use in human or veterinary medicine, by analogy with other pharmaceuticals.

[00129] In another aspect, the present invention provides pharmaceutically acceptable compositions which comprise a therapeutically-effective amount of one or more of the subject compounds, as described above, formulated together with one or more pharmaceutically acceptable carriers (additives) and/or diluents. As described in detail below, the pharmaceutical compositions of the present invention may be specially formulated for administration in solid or liquid form, including those adapted for the following: (1) oral administration, for example, drenches (aqueous or non-aqueous solutions or suspensions), tablets, boluses, powders, granules, pastes for application to the tongue; (2) parenteral administration, for example, by subcutaneous, intramuscular or intravenous injection as, for example, a sterile solution or suspension; (3) topical application, for example, as a cream, ointment or spray applied to the skin, lungs, or mucous membranes; or (4) intravaginally or intrarectally, for example, as a pessary, cream or foam; (5) sublingually or buccally; (6) ocularly; (7) transdermally; or (8) nasally.

[00130] The term "treatment" is intended to encompass also prophylaxis, therapy and cure.

[00131] The patient receiving this treatment is any animal in need, including primates, in particular humans, and other mammals such as equines, cattle, swine and sheep; and poultry and pets in general.

[00132] The compound of the invention can be administered as such or in admixtures with pharmaceutically acceptable carriers and can also be administered in conjunction with

antimicrobial agents such as penicillins, cephalosporins, aminoglycosides and glycopeptides. Conjunctive therapy, thus includes sequential, simultaneous and separate administration of the active compound in a way that the therapeutical effects of the first administered one is not entirely disappeared when the subsequent is administered.

[00133] Microemulsification technology can improve bioavailability of some lipophilic (water insoluble) pharmaceutical agents. Examples include Trimetrine (Dordunoo, S. K., et al., Drug Development and Industrial Pharmacy, 17(12), 1685-1713, 1991 and REV 5901 (Sheen, P. C., et al., J Pharm Sci 80(7), 712-714, 1991). Among other things, microemulsification provides enhanced bioavailability by preferentially directing absorption to the lymphatic system instead of the circulatory system, which thereby bypasses the liver, and prevents destruction of the compounds in the hepatobiliary circulation.

[00134] While all suitable amphiphilic carriers are contemplated, the presently preferred carriers are generally those that have Generally-Recognized-as-Safe (GRAS) status, and that can both solubilize the compound of the present invention and microemulsify it at a later stage when the solution comes into a contact with a complex water phase (such as one found in human gastrointestinal tract). Usually, amphiphilic ingredients that satisfy these requirements have HLB (hydrophilic to lipophilic balance) values of 2-20, and their structures contain straight chain aliphatic radicals in the range of C-6 to C-20. Examples are polyethylene-glycolized fatty glycerides and polyethylene glycols.

[00135] Commercially available amphiphilic carriers are particularly contemplated, including Gelucire-series, Labrafil, Labrasol, or Lauroglycol (all manufactured and distributed by Gattefosse Corporation, Saint Priest, France), PEG-mono-oleate, PEG-di-oleate, PEG-mono-laurate and di-laurate, Lecithin, Polysorbate 80, etc (produced and distributed by a number of companies in USA and worldwide).

[00136] Hydrophilic polymers suitable for use in the present invention are those which are readily water-soluble, can be covalently attached to a vesicle-forming lipid, and which are tolerated in vivo without toxic effects (i.e., are biocompatible). Suitable polymers include polyethylene glycol (PEG), polylactic (also termed polylactide), polyglycolic acid (also termed polyglycolide), a polylactic-polyglycolic acid copolymer, and polyvinyl alcohol. Preferred polymers are those having a molecular weight of from about 100 or 120 daltons up to about 5,000

or 10,000 daltons, and more preferably from about 300 daltons to about 5,000 daltons. In a particularly preferred embodiment, the polymer is polyethyleneglycol having a molecular weight of from about 100 to about 5,000 daltons, and more preferably having a molecular weight of from about 300 to about 5,000 daltons. In a particularly preferred embodiment, the polymer is polyethyleneglycol of 750 daltons (PEG(750)). Polymers may also be defined by the number of monomers therein; a preferred embodiment of the present invention utilizes polymers of at least about three monomers, such PEG polymers consisting of three monomers (approximately 150 daltons).

[00137] Other hydrophilic polymers which may be suitable for use in the present invention include polyvinylpyrrolidone, polymethoxazoline, polyethyloxazoline, polyhydroxypropyl methacrylamide, polymethacrylamide, polydimethylacrylamide, and derivatized celluloses such as hydroxymethylcellulose or hydroxyethylcellulose.

[00138] In certain embodiments, a formulation of the present invention comprises a biocompatible polymer selected from the group consisting of polyamides, polycarbonates, polyalkylenes, polymers of acrylic and methacrylic esters, polyvinyl polymers, polyglycolides, polysiloxanes, polyurethanes and co-polymers thereof, celluloses, polypropylene, polyethylenes, polystyrene, polymers of lactic acid and glycolic acid, polyanhydrides, poly(ortho)esters, poly(butic acid), poly(valeric acid), poly(lactide-co-caprolactone), polysaccharides, proteins, polyhyaluronic acids, polycyanoacrylates, and blends, mixtures, or copolymers thereof.

[00139] Cyclodextrins are cyclic oligosaccharides, consisting of 6, 7 or 8 glucose units, designated by the Greek letter .alpha., .beta. or .gamma., respectively. Cyclodextrins with fewer than six glucose units are not known to exist. The glucose units are linked by alpha-1,4-glucosidic bonds. As a consequence of the chair conformation of the sugar units, all secondary hydroxyl groups (at C-2, C-3) are located on one side of the ring, while all the primary hydroxyl groups at C-6 are situated on the other side. As a result, the external faces are hydrophilic, making the cyclodextrins water-soluble. In contrast, the cavities of the cyclodextrins are hydrophobic, since they are lined by the hydrogen of atoms C-3 and C-5, and by ether-like oxygens. These matrices allow complexation with a variety of relatively hydrophobic compounds, including, for instance, steroid compounds such as 17.beta.-estradiol (see, e.g., van Uden et al. Plant Cell Tiss. Org. Cult. 38:1-3-113 (1994)). The complexation takes place by Van der Waals interactions and

by hydrogen bond formation. For a general review of the chemistry of cyclodextrins, see, Wenz, *Agnew. Chem. Int. Ed. Engl.*, 33:803-822 (1994).

[00140] The physico-chemical properties of the cyclodextrin derivatives depend strongly on the kind and the degree of substitution. For example, their solubility in water ranges from insoluble (e.g., triacetyl-beta-cyclodextrin) to 147% soluble (w/v) (G-2-beta-cyclodextrin). In addition, they are soluble in many organic solvents. The properties of the cyclodextrins enable the control over solubility of various formulation components by increasing or decreasing their solubility.

[00141] Numerous cyclodextrins and methods for their preparation have been described. For example, Parmeter (I), et al. (U.S. Pat. No. 3,453,259) and Gramera, et al. (U.S. Pat. No. 3,459,731) described electroneutral cyclodextrins. Other derivatives include cyclodextrins with cationic properties [Parmeter (II), U.S. Pat. No. 3,453,257], insoluble crosslinked cyclodextrins (Solms, U.S. Pat. No. 3,420,788), and cyclodextrins with anionic properties [Parmeter (III), U.S. Pat. No. 3,426,011]. Among the cyclodextrin derivatives with anionic properties, carboxylic acids, phosphorous acids, phosphinous acids, phosphonic acids, phosphoric acids, thiophosphonic acids, thiosulphinic acids, and sulfonic acids have been appended to the parent cyclodextrin [see, Parmeter (III), *supra*]. Furthermore, sulfoalkyl ether cyclodextrin derivatives have been described by Stella, et al. (U.S. Pat. No. 5,134,127).

[00142] Liposomes consist of at least one lipid bilayer membrane enclosing an aqueous internal compartment. Liposomes may be characterized by membrane type and by size. Small unilamellar vesicles (SUVs) have a single membrane and typically range between 0.02 and 0.05 μm in diameter; large unilamellar vesicles (LUVS) are typically larger than 0.05 μm . Oligolamellar large vesicles and multilamellar vesicles have multiple, usually concentric, membrane layers and are typically larger than 0.1 μm . Liposomes with several nonconcentric membranes, i.e., several smaller vesicles contained within a larger vesicle, are termed multivesicular vesicles.

[00143] One aspect of the present invention relates to formulations comprising liposomes containing a compound of the present invention, where the liposome membrane is formulated to provide a liposome with increased carrying capacity. Alternatively or in addition, the compound of the present invention may be contained within, or adsorbed onto, the liposome

bilayer of the liposome. The compound of the present invention may be aggregated with a lipid surfactant and carried within the liposome's internal space; in these cases, the liposome membrane is formulated to resist the disruptive effects of the active agent-surfactant aggregate.

[00144] According to one embodiment of the present invention, the lipid bilayer of a liposome contains lipids derivatized with polyethylene glycol (PEG), such that the PEG chains extend from the inner surface of the lipid bilayer into the interior space encapsulated by the liposome, and extend from the exterior of the lipid bilayer into the surrounding environment.

[00145] Active agents contained within liposomes of the present invention are in solubilized form. Aggregates of surfactant and active agent (such as emulsions or micelles containing the active agent of interest) may be entrapped within the interior space of liposomes according to the present invention. A surfactant acts to disperse and solubilize the active agent, and may be selected from any suitable aliphatic, cycloaliphatic or aromatic surfactant, including but not limited to biocompatible lysophosphatidylcholines (LPCs) of varying chain lengths (for example, from about C.sub.14 to about C.sub.20). Polymer-derivatized lipids such as PEG-lipids may also be utilized for micelle formation as they will act to inhibit micelle/membrane fusion, and as the addition of a polymer to surfactant molecules decreases the CMC of the surfactant and aids in micelle formation. Preferred are surfactants with CMCs in the micromolar range; higher CMC surfactants may be utilized to prepare micelles entrapped within liposomes of the present invention, however, micelle surfactant monomers could affect liposome bilayer stability and would be a factor in designing a liposome of a desired stability.

[00146] Liposomes according to the present invention may be prepared by any of a variety of techniques that are known in the art. See, e.g., U.S. Pat. No. 4,235,871; Published PCT applications WO 96/14057; New RRC, Liposomes: A practical approach, IRL Press, Oxford (1990), pages 33-104; Lasic DD, Liposomes from physics to applications, Elsevier Science Publishers BV, Amsterdam, 1993.

[00147] For example, liposomes of the present invention may be prepared by diffusing a lipid derivatized with a hydrophilic polymer into preformed liposomes, such as by exposing preformed liposomes to micelles composed of lipid-grafted polymers, at lipid concentrations corresponding to the final mole percent of derivatized lipid which is desired in the liposome.

Liposomes containing a hydrophilic polymer can also be formed by homogenization, lipid-field hydration, or extrusion techniques, as are known in the art.

[00148] In one aspect of the present invention, the liposomes are prepared to have substantially homogeneous sizes in a selected size range. One effective sizing method involves extruding an aqueous suspension of the liposomes through a series of polycarbonate membranes having a selected uniform pore size; the pore size of the membrane will correspond roughly with the largest sizes of liposomes produced by extrusion through that membrane. See e.g., U.S. Pat. No. 4,737,323 (Apr. 12, 1988).

[00149] The release characteristics of a formulation of the present invention depend on the encapsulating material, the concentration of encapsulated drug, and the presence of release modifiers. For example, release can be manipulated to be pH dependent, for example, using a pH sensitive coating that releases only at a low pH, as in the stomach, or a higher pH, as in the intestine. An enteric coating can be used to prevent release from occurring until after passage through the stomach. Multiple coatings or mixtures of cyanamide encapsulated in different materials can be used to obtain an initial release in the stomach, followed by later release in the intestine. Release can also be manipulated by inclusion of salts or pore forming agents, which can increase water uptake or release of drug by diffusion from the capsule. Excipients which modify the solubility of the drug can also be used to control the release rate. Agents which enhance degradation of the matrix or release from the matrix can also be incorporated. They can be added to the drug, added as a separate phase (i.e., as particulates), or can be co-dissolved in the polymer phase depending on the compound. In all cases the amount should be between 0.1 and thirty percent (w/w polymer). Types of degradation enhancers include inorganic salts such as ammonium sulfate and ammonium chloride, organic acids such as citric acid, benzoic acid, and ascorbic acid, inorganic bases such as sodium carbonate, potassium carbonate, calcium carbonate, zinc carbonate, and zinc hydroxide, and organic bases such as protamine sulfate, spermine, choline, ethanolamine, diethanolamine, and triethanolamine and surfactants such as Tween® and Pluronic®. Pore forming agents which add microstructure to the matrices (i.e., water soluble compounds such as inorganic salts and sugars) are added as particulates. The range should be between one and thirty percent (w/w polymer).

[00150] Uptake can also be manipulated by altering residence time of the particles in the gut. This can be achieved, for example, by coating the particle with, or selecting as the encapsulating material, a mucosal adhesive polymer. Examples include most polymers with free carboxyl groups, such as chitosan, celluloses, and especially polyacrylates (as used herein, polyacrylates refers to polymers including acrylate groups and modified acrylate groups such as cyanoacrylates and methacrylates).

Processes for Making Compounds of the Invention

[00225] The present invention also includes processes for the preparation of compounds of the invention. In the reactions described, it can be necessary to protect reactive functional groups, for example hydroxy, amino, imino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups can be used in accordance with standard practice, for example, see T.W. Greene and P. G. M. Wuts in "Protective Groups in Organic Chemistry", John Wiley and Sons, 1991.

[00226] Compounds of Formula I, shown here where R_{8a} is hydrogen, can be prepared by proceeding as in the following General Reaction Scheme I:

General Reaction Scheme I:

[00227] in which R_1 , R_5 and R_{8b} are as defined for Formula I in the Summary of the Invention. A compound of Formula I can be prepared by reacting a compound of formula I (where R_3 has a double bond as shown above) with a suitable reducing agent (such as H_2 , and the like) and a suitable catalyst (such as Palladium on carbon (Pd/C), or the like), under a suitable pressure (such as about 1 atm to about 5 atm). The reaction takes place at about 0°C - 50°C and can take from about 1 to about 24 hours to complete.

[00228] Compounds of Formula I, shown here where R_{8a} is hydrogen and R_3 has a double bond, can be prepared by proceeding as in the following General Reaction Scheme II:

[00230] Detailed examples of the synthesis of compounds of Formula I can be found in the Examples, *infra*.

Additional Processes for Making Compounds of the Invention

[00231] A compound of the invention can be prepared as a pharmaceutically acceptable acid addition salt by reacting the free base form of the compound with a pharmaceutically acceptable inorganic or organic acid. Alternatively, a pharmaceutically acceptable base addition salt of a compound of the invention can be prepared by reacting the free acid form of the compound with a pharmaceutically acceptable inorganic or organic base.

[00232] Compounds of the formula I can also be modified by appending appropriate functionalities to enhance selective biological properties. Modifications of this kind are known in the art and include those that increase penetration into a given biological system (e.g. blood, lymphatic system, central nervous system, testis), increase bioavailability, increase solubility to allow parenteral administration (e.g. injection, infusion), alter metabolism and/or alter the rate of secretion. Examples of this type of modifications include but are not limited to esterification, e.g. with polyethylene glycols, derivatisation with pivaloyloxy or fatty acid substituents, conversion to carbamates, hydroxylation of aromatic rings and heteroatom substitution in aromatic rings.

Wherever compounds of the formula I, and/or N-oxides, tautomers and/or (preferably pharmaceutically acceptable) salts thereof are mentioned, this comprises such modified formulae, while preferably the molecules of the formula I, their N-oxides, their tautomers and/or their salts are meant.

[00233] Alternatively, the salt forms of the compounds of the invention can be prepared using salts of the starting materials or intermediates. In view of the close relationship between the novel compounds of the formula I in free form and those in the form of their salts, including those salts that can be used as intermediates, for example in the purification or identification of the novel compounds, any reference to the compounds or a compound of the formula I hereinbefore

and hereinafter is to be understood as referring to the compound in free form and/or also to one or more salts thereof, as appropriate and expedient, as well as to one or more solvates, e.g. hydrates.

[00234] Salts are formed, for example, as acid addition salts, preferably with organic or inorganic acids, from compounds of formula I with a basic nitrogen atom, especially the pharmaceutically acceptable salts. Suitable inorganic acids are, for example, halogen acids, such as hydrochloric acid, sulfuric acid, or phosphoric acid. Suitable organic acids are, for example, carboxylic, phosphonic, sulfonic or sulfamic acids, for example acetic acid, propionic acid, octanoic acid, decanoic acid, dodecanoic acid, glycolic acid, lactic acid, fumaric acid, succinic acid, malonic acid, adipic acid, pimelic acid, suberic acid, azelaic acid, malic acid, tartaric acid, citric acid, amino acids, such as glutamic acid or aspartic acid, maleic acid, hydroxymaleic acid, methylmaleic acid, cyclohexanecarboxylic acid, adamantanecarboxylic acid, benzoic acid, salicylic acid, 4-aminosalicylic acid, phthalic acid, phenylacetic acid, mandelic acid, cinnamic acid, methane- or ethane-sulfonic acid, 2-hydroxyethanesulfonic acid, ethane-1,2-disulfonic acid, benzenesulfonic acid, 4-toluenesulfonic acid, 2-naphthalenesulfonic acid, 1,5-naphthalene-disulfonic acid, 2- or 3-methylbenzenesulfonic acid, methylsulfuric acid, ethylsulfuric acid, dodecylsulfuric acid, N-cyclohexylsulfamic acid, N-methyl-, N-ethyl- or N-propyl-sulfamic acid, or other organic protonic acids, such as ascorbic acid.

[00235] For isolation or purification purposes it is also possible to use pharmaceutically unacceptable salts, for example picrates or perchlorates. For therapeutic use, only pharmaceutically acceptable salts or free compounds are employed (where applicable in the form of pharmaceutical preparations), and these are therefore preferred.

[00236] The free acid or free base forms of the compounds of the invention can be prepared from the corresponding base addition salt or acid addition salt from, respectively. For example a compound of the invention in an acid addition salt form can be converted to the corresponding free base by treating with a suitable base (e.g., ammonium hydroxide solution, sodium hydroxide, and the like). A compound of the invention in a base addition salt form can be converted to the corresponding free acid by treating with a suitable acid (e.g., hydrochloric acid, etc.).

[00237] Compounds of the invention in unoxidized form can be prepared from N-oxides of compounds of the invention by treating with a reducing agent (e.g., sulfur, sulfur

dioxide, triphenyl phosphine, lithium borohydride, sodium borohydride, phosphorus trichloride, tribromide, or the like) in a suitable inert organic solvent (e.g. acetonitrile, ethanol, aqueous dioxane, or the like) at 0 to 80°C.

[00238] Prodrug derivatives of the compounds of the invention can be prepared by methods known to those of ordinary skill in the art (e.g., for further details see Saulnier et al., (1994), *Bioorganic and Medicinal Chemistry Letters*, Vol. 4, p. 1985; Ferriz, J.M. et al., *Current Pharmaceutical Design*, 2010, 16, 2033-2052). Examples of prodrug derivatives of compounds of the invention can be:

[00239] Protected derivatives of the compounds of the invention can be made by means known to those of ordinary skill in the art. A detailed description of techniques applicable to the creation of protecting groups and their removal can be found in T. W. Greene, "Protecting Groups in Organic Chemistry", 3rd edition, John Wiley and Sons, Inc., 1999.

[00240] Compounds of the present invention can be conveniently prepared, or formed during the process of the invention, as solvates (e.g., hydrates). Hydrates of compounds of the present invention can be conveniently prepared by recrystallization from an aqueous/organic solvent mixture, using organic solvents such as dioxin, tetrahydrofuran or methanol.

[00241] Compounds of the invention can be prepared as their individual stereoisomers by reacting a racemic mixture of the compound with an optically active resolving agent to form a pair of diastereoisomeric compounds, separating the diastereomers and recovering the optically pure enantiomers. While resolution of enantiomers can be carried out using covalent diastereomeric derivatives of the compounds of the invention, dissociable complexes are preferred (e.g., crystalline diastereomeric salts). Diastereomers have distinct physical properties (e.g., melting points, boiling points, solubilities, reactivity, etc.) and can be readily separated by taking advantage of these dissimilarities. The diastereomers can be separated by chromatography, or preferably, by separation/resolution techniques based upon differences in solubility. The optically pure enantiomer is then recovered, along with the resolving agent, by any practical means that would not result in racemization. A more detailed description of the techniques applicable to the resolution of stereoisomers of compounds from their racemic mixture can be found in Jean Jacques, Andre Collet, Samuel H. Wilen, "Enantiomers, Racemates and Resolutions", John Wiley And Sons, Inc., 1981.

[00242] In summary, the compounds of Formula I can be made by a process, which involves:

- (a) those of general reaction schemes I and II; and
- (b) optionally converting a compound of the invention into a pharmaceutically acceptable salt;
- (c) optionally converting a salt form of a compound of the invention to a non-salt form;
- (d) optionally converting an unoxidized form of a compound of the invention into a pharmaceutically acceptable N-oxide;
- (e) optionally converting an N-oxide form of a compound of the invention to its unoxidized form;
- (f) optionally resolving an individual isomer of a compound of the invention from a mixture of isomers;
- (g) optionally converting a non-derivatized compound of the invention into a pharmaceutically acceptable prodrug derivative; and

(b) optionally converting a prodrug derivative of a compound of the invention to its non-derivatized form.

[00243] Insofar as the production of the starting materials is not particularly described, the compounds are known or can be prepared analogously to methods known in the art or as disclosed in the Examples hereinafter.

[00244] One of skill in the art will appreciate that the above transformations are only representative of methods for preparation of the compounds of the present invention, and that other well known methods can similarly be used.

Examples

[00334] For synthesis of examples 1-55: the following examples have been prepared from the corresponding intermediates by removing the methyl group(s) from the phenolic ether(s) and in some cases also removing a *tert*-butyl group from a carboxylic ester functionality in the same step.

General method A

[00335] To a solution of the above described intermediate in DCM (0.02-0.1 M) at 0°C was added BBr₃ (1 M in DCM, 1.5 -3 eq per MeO- group) dropwise. The resulting dark mixture was stirred at 0°C for 1-3 h after which the reaction was quenched with ice water or sat. aq. NaHCO₃ solution. The mixture was allowed to warm up to room temperature and extracted with 5% MeOH in EtOAc. The combined organic phases were concentrated and the crude product dissolved in MeOH and purified by RP-HPLC to provide the example.

General method B:

[00336] To a solution of the above described intermediate in DCM (0.02-0.1 M) at 0°C added BBr₃ (1 M in hexanes, 1.5 – 3 eq. per MeO- group) dropwise. The resulting dark mixture was stirred at 0°C for 1-3 h after which the reaction was quenched with methanol. The mixture was concentrated to a small volume and purified by RP-HPLC to provide the example.

Example 139

(E)-3-(4-((2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-6-hydroxybenzo[b]thiophen-3-yl)oxy)phenyl)acrylic acid

[00389] Step 1: 2-bromo-3-(4-bromophenoxy)-6-methoxybenzo[b]thiophene 1,1-dioxide (compound 26). To a solution of 2,3-dibromo-6-methoxybenzo[b]thiophene 1,1-dioxide (2.50 g, 7.06 mmol) in THF (100 mL) at room temperature was added 4-bromophenol (1.344 g, 7.77 mmol) and Cs₂CO₃ (6.90 g, 21.19 mmol). The reaction mixture turned green after ~1 min of stirring. The mixture was stirred at room temperature for 18 h after which time the reaction was quenched with water and diluted with DCM. The organic layer was collected (phase separator) and concentrated to provide 2-bromo-3-(4-bromophenoxy)-6-methoxybenzo[b]thiophene 1,1-dioxide (3.10 g, 6.95 mmol, 98% yield) as a white solid which was used without further purification. ¹H NMR (400 MHz, CDCl₃) δ ppm = 3.83 (s, 3 H), 6.92-7.03 (m, 3 H), 7.25-7.35 (m, 2 H), 7.39-7.50 (m, 2 H).

[00390] Step 2: 3-(4-bromophenoxy)-6-methoxybenzo[*b*]thiophene 1,1-dioxide (compound 27). To a solution of 2-bromo-3-(4-bromophenoxy)-6-methoxy-benzo[*b*]thiophene 1,1-dioxide (3.10 g, 6.95 mmol) in MeOH (10 mL) and DMSO (30 mL) was added NaBH₄ (0.789 g, 20.85 mmol). The mixture was stirred at room temperature for 3 h after which time the reaction was quenched with water and diluted with DCM. The organic layer was collected (phase separator) and concentrated to provide 3-(4-bromophenoxy)-6-methoxybenzo[*b*]thiophene 1,1-dioxide (2.47 g, 6.73 mmol, 97% yield) as an off white solid which was used without further purification. ¹H NMR (400 MHz, CDCl₃) δ ppm = 3.85 (s, 3 H), 5.38 (s, 1 H), 7.02-7.08 (m, 3 H), 7.22 (d, *J* = 2.53 Hz, 1 H), 7.47-7.60 (m, 3 H).

[00391] Step 3: 3-(4-bromophenoxy)-6-methoxybenzo[*b*]thiophene (compound 28). To a solution of 3-(4-bromophenoxy)-6-methoxybenzo[*b*]thiophene 1,1-dioxide (2.47 g, 6.73 mmol) in THF (90 mL) was added DIBAL-H (1.0 M in DCM, 33.6 mL, 33.6 mmol) in one portion. The mixture was heated to 75 °C for 2 h after which time the reaction was cooled to room temperature and quenched with EtOAc (32.9 mL, 336 mmol). The resulting solution was stirred for 10 min before carefully adding 75 mL of water and potassium sodium tartrate (33.100 g, 117 mmol). The mixture was vigorously stirred for 10 min and diluted with 75 mL EtOAc. The organic layer was collected, dried with anhydrous MgSO₄ and concentrated *in vacuo* to afford 3-(4-bromophenoxy)-6-methoxybenzo[*b*]thiophene (1.9 g, 5.67 mmol, 84% yield) as a white solid which was used without further purification. ¹H NMR (400 MHz, CDCl₃) δ ppm = 3.81 (s, 3 H), 6.46 (s, 1 H), 6.90 (d, *J* = 9.09 Hz, 3 H), 7.16-7.22 (m, 1 H), 7.31-7.40 (m, 2 H), 7.46 (d, *J* = 9.09 Hz, 1 H). LC/MS (*m/z*, MH⁺): 336.8.

[00392] Step 4: (*E*)-methyl 3-(4-((6-methoxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (compound 29). To a microwave vial, 3-(4-bromophenoxy)-6-methoxybenzo[*b*]thiophene (500 mg, 1.49 mmol), methyl acrylate (770 mg, 8.95 mmol), and Pd(PPh₃)₂Cl₂ (157 mg, 0.22 mmol) were suspended in DMF (12 mL) and triethylamine (1.039 mL, 7.46 mmol). The reaction was heated for 60 min at 120 °C under microwave irradiation. The reaction mixture was diluted with DCM and water. The organic layer was collected (phase separator) and concentrated to obtain the crude product. The crude material was purified by column chromatography (SiO₂, 1-20% EtOAc/Heptane) to afford (*E*)-methyl 3-(4-((6-methoxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (311 mg, 0.91 mmol, 61% yield) as a white solid. ¹H NMR (400 MHz, CDCl₃) δ ppm = 1.46 (s, 3 H), 3.73 (s, 3 H), 6.28 (d, *J* = 16.17 Hz, 1

[00393] Step 5: (*E*)-methyl 3-(4-((2-bromo-6-methoxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (compound 134). To a solution (*E*)-methyl 3-(4-((6-methoxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (2.1 g, 6.17 mmol) in THF 201 mL) at room temperature was added *N*-bromosuccinimide (1.208 g, 6.79 mmol). The resulting solution was stirred vigorously at room temperature for 2 h after which time the reaction was quenched by addition of sat. aq. Sodium Thiosulfate solution and extracted with EtOAc (3×). The combined organic layers were dried over anhydrous $MgSO_4$, filtered and concentrated *in vacuo*. The resulting crude material was purified by column chromatography (SiO_2 , 0-40% EtOAc/Heptane) to afford (*E*)-methyl 3-(4-((2-bromo-6-methoxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (2.4 g, 5.72 mmol, 93% yield). 1H NMR (400 MHz, $CDCl_3$) δ ppm 7.65 (d, $J = 16.0$ Hz, 1H), 7.46 (d, $J = 8.7$ Hz, 2H), 7.32 (d, $J = 8.9$ Hz, 1H), 7.20 (d, $J = 2.2$ Hz, 1H), 6.95 (d, $J = 8.7$ Hz, 2H), 6.91 (dd, $J = 8.8, 2.2$ Hz, 1H), 6.31 (s, 1H), 3.86 (s, 3H), 3.79 (s, 3H). LC/MS (m/z , MH^+): 420.9.

[00394] Step 6: (*E*)-methyl 3-(4-((2-bromo-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate & (*E*)-3-(4-((2-bromo-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylic acid (compound 135 & 136). To a solution of (*E*)-methyl 3-(4-((2-bromo-6-methoxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (2.4 g, 5.72 mmol) in DCM (20 mL) at room temperature was added BBr_3 (1.0 M in Heptane, 17.17 mL, 17.17 mmol) dropwise. The resulting mixture was stirred at room temperature for 2 h after which time an aqueous buffer (pH 7.4, made from citric acid and dibasic sodium phosphate, 10 mL), cooled to 0°C, was slowly added into the reaction. The resulting mixture was then diluted with DCM (30 mL) and stirred at room temperature for 1 h. The phases were then separated and the organic phase was dried over anhydrous Na_2SO_4 , filtered and concentrated *in vacuo*. The crude material was purified by column chromatography (SiO_2 , 0-100% EtOAc/Heptane) to afford (*E*)-methyl 3-(4-((2-bromo-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (1.6 g, 3.95 mmol, 69% yield) as a pale yellow solid and (*E*)-3-(4-((2-bromo-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylic acid (370 mg, 0.946 mmol, 17% yield) as a yellow solid.

The combine organic layers were concentrated and *in vacuo* and purified by column chromatography (SiO₂, 0-20% EtOAc/Heptane) to afford 1-bromo-2-(1,1-difluoroethyl)-4-fluorobenzene (3.83 g, 16.02 mmol, 69.6 % yield) as a colorless oil. ¹H NMR (400 MHz, CD₃OD) δ ppm 1.98 - 2.11 (m, 3H), 7.15 (td, J=8.21, 3.28 Hz, 1H), 7.39 (dd, J=9.60, 3.03 Hz, 1H), 7.71 (dd, J=8.59, 5.05 Hz, 1H). ¹⁹F NMR (376 MHz, CD₃OD) δ ppm -115.63 (s, 1 F), -88.94 (s, 2 F).

[00398] Step 8: 2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (compound 150). To a solution of 1-bromo-2-(1,1-difluoroethyl)-4-fluorobenzene (3.83 g, 16.02 mmol) in 1,4-dioxane (15 mL) was added bis(pinacolato)diboron (5.29 g, 20.83 mmol), potassium acetate (3.15 g, 32.0 mmol) and PdCl₂(PPh₃)₂ (1.125 g, 1.602 mmol). The resulting mixture was heated to 80°C and stirred under nitrogen atmosphere for 18 h after which time the mixture was cooled to room temperature and concentrated onto silica gel. The crude material was then purified by column chromatography (SiO₂, 0-15% EtOAc/Heptane) to afford 2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (2.90 g, 10.14 mmol, 63% yield) as a colorless oil. ¹H NMR (400 MHz, CD₃OD) δ ppm 1.37 (s, 12 H), 2.01 (t, J=18.44 Hz, 3 H), 7.18 (td, J=8.34, 2.53 Hz, 1 H), 7.25 (dd, J=10.11, 2.53 Hz, 1 H), 7.62 (dd, J=8.08, 6.57 Hz, 1 H).

[00399] Step 9: (E)-methyl 3-(4-((2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-6-hydroxybenzo[b]thiophen-3-yl)oxy)phenyl)acrylate (compound 151). To a solution of (E)-methyl 3-(4-((2-bromo-6-hydroxybenzo[b]thiophen-3-yl)oxy)phenyl)acrylate (1.6 g, 3.95 mmol) in toluene (20 mL) and water (2 mL) was added 2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (2.259 g, 7.90 mmol), K₂CO₃ (2.73 g, 19.74 mmol), and Pd(PPh₃)₄ (0.456 g, 0.395 mmol). The resulting mixture was heated to 90°C for 18 h after which

time the reaction was cooled to room temp and filtered to remove solids. The filtrate was acidified with HCl (1N aq.) and extracted with DCM, the combined organic layers were dried over anhydrous Na₂SO₄, filtered and concentrated *in vacuo*. The resulting crude material was purified by column chromatography (SiO₂, 0-60% EtOAc/Heptane) to afford (*E*)-methyl 3-(4-((2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (1.4 g, 2.89 mmol, 73.2% yield) as a pale orange solid. The product was dissolved in DCM and treated with Pd scavenger for 2 h at room temp then filtered and collected the filtrate and concentrated *in vacuo* to afford the final product. ¹H NMR (400 MHz, CD₃OD) δ ppm 1.89 (t, J=18.69 Hz, 3H), 3.75 (s, 3H), 6.37 (d, J=16.17 Hz, 1H), 6.80 - 6.89 (m, 3H), 7.11 (td, J=8.21, 2.78 Hz, 1H), 7.17 - 7.25 (m, 2H), 7.31 - 7.42 (m, 2H), 7.44 - 7.51 (m, 2H), 7.59 (d, J=16.17 Hz, 1H).

[00400] Step 10: (*E*)-3-(4-((2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylic acid (example 140). To a solution of (*E*)-methyl 3-(4-((2-(2-(1,1-difluoroethyl)-4-fluorophenyl)-6-hydroxybenzo[*b*]thiophen-3-yl)oxy)phenyl)acrylate (1.4 g, 2.89) in THF (5 mL) and water (3 mL) was added 56% LiOH monohydrate (371 mg, 8.67 mmol). The resulting mixture was stirred at room temperature for 18 h after which time the reaction was concentrated *in vacuo* to remove THF and the resulting solution was diluted with water and acidified by addition of HCl (1N aq.), causing a precipitate to crash out. LC/MS (m/z, M-H): 468.9.

Assays

[00401] Compounds of the invention were assessed for their ability to be both potent estrogen receptor antagonists and to degrade estrogen receptors. The antagonist and degrading properties of the compounds of the invention described herein can be evidenced by testing in the ER transcription and ERα degradation assays, respectively.

ER Transcription Assay (MCF7 Cells)

[00402] The ER transcription assay is a reporter assay that is based on the ability of ER to induce transcription from a luciferase reporter gene containing estrogen response elements (EREs) in the promoter/enhancer region. When the reporter gene is transfected in MCF7 cells (containing endogenous ER), transcription is reflected by the level of luciferase expression.

[00403] MCF7 cells are maintained in DMEM/F12 (Gibco, catalog number 11330) supplemented with 10% fetal bovine serum (FBS) (Gemini Bio-Products, catalog number 100-106). A day before transfection, cells are split into a T75 flask at a cell density of 300,000 cells/mL (10mL total) and allowed to attach overnight in a humidified CO₂ incubator at 37°C.

[00404] Next day, prior to transfection, media is switched to DMEM/F12 (Gibco, catalog number 21041) supplemented with 10% charcoal-stripped serum (Gemini Bio-Products, catalog number 100-119). MCF7 cells are then bulk transfected, using Lipofectin (Invitrogen, catalog number 18292) with the following plasmids: 7x-TK-ERE-Luc3 (ER reporter gene) and pCMV-Renilla (normalization control). Briefly, for each T75 flask, 32.5 µL of Lipofectin is added to 617.5 µL of OptiMEM (Gibco #11058) and incubated for 30 min at 37°C. Approximately 20 µg DNA is mixed in OptiMEM (Invitrogen) to a total volume of 650 µL. Following incubation, the OptiMEM-DNA mixture is added to the OptiMEM-Lipofectin mix and incubated for 15 minutes at 37°C. The DNA-Lipofectin mixture is then added directly to the T75 flask and the flask is returned to the incubator.

[00405] After overnight incubation, compound is added to individual wells of a 96-well plate in a 10 µL volume of media at 10x concentration along with 17β estradiol whose final concentration is 0.1 nM. Normally, DMSO (used as a vehicle) is included to achieve a final concentration of 0.1% when added to the cells. Transfected cells are trypsinized, resuspended in DMEM/F12/10% charcoal-stripped serum and added to the 96-well plate at 25,000 cells/well in 90µL of media. The plate is then returned to the incubator for 24 hours.

[00406] After incubation with compounds for 24 hours, Firefly and Renilla luciferase activities are measured to determine ER transcriptional activity. Media is removed from 96-well plates by decanting and blotting on paper towels. Cells are lysed with 40ul/well of 1X passive lysis buffer (25mM Tris Phosphate, 2mM CDTA, 10% Glycerol, 0.5% Triton X-100 and 2mM DTT before use) and allowed incubate at room temperature for 10 minutes.

[00407] Firefly luciferase activity is measured by adding 30 ul Firefly luciferase assay buffer (20mM Tricine, 0.1 mM EDTA, 1.07 mM (MgCO₃)₄ Mg(OH)₂ • 5H₂O, 2.67 mM MgSO₄,

33.3 mM DTT, 270 μ M Coenzyme A, 470 μ M luciferin, 530 μ M ATP, reconstituted) per well, followed by measuring light units using a luminometer (BMG labtech FLUOstar OPTIMA). One second total read time after a one second delay.

[00408] Renilla luciferase activity is measured by adding 50 μ l Renilla luciferase assay buffer (1.1M NaCl, 2.2 mM Na₂EDTA, 0.22 M K₂PO₄ (pH 5.1), 0.44 mg/mL BSA, 1.3 mM NaN₃, 1.43 μ M coelenterazine, final pH adjusted to 5.0), per well, followed by measuring light units using a luminometer. One second total read time after one second delay. If Firefly luciferase signal is high, Renilla assay must be done an hour after the Firefly assay due to incomplete squelching of Firefly signal.

ER α degradation (MCF7 cells)

[00409] Plate MCF7 cells at 0.3 million cells/mL (100 μ l/well) in black, clear-bottom 96-well plates (Greiner, catalog number 655090) in DMEM/F12 media (Gibco, catalog number 11330) supplemented with 10% charcoal-stripped serum (Gemini Bio-Products, catalog number 100-119), and incubate them at 37°C, 5% CO₂ for 24-36 hours. Next day, make 10x solution of ligands in DMSO and add the solution to the cells to achieve a final concentration of 10 μ M. A DMSO control is required for relative calculations, and fulvestrant is used as a positive control for ER degradation. The cells are subjected to the in-cell Western assay after incubating cells with ligand for 18-24 hours.

[00410] Media is removed from the plates by decanting, and cells are immediately fixed with 100 μ l of 3.7% formaldehyde in PBS using a multi-channel pipettor. Add formaldehyde to the sides of the wells to avoid cell disruption. Plates are incubated at room temperature for 20 minutes without shaking. The fix solution is then removed and cells are permeabilized with 100 μ L/well of 0.1% Triton X-100 in PBS. The lysate is then blocked by adding 50 μ L/well of blocking solution (3% goat serum, 1% BSA, 0.1% cold fish skin gelatin and 0.1% Triton X-100 in PBS, pH 7.4) and allowed to shake at room temperature for 2 hr, or alternatively, at 4°C overnight.

[00411] After blocking, 40 μ L/well of the primary antibody against ER α (HC-20) (Santa cruz, catalog number 543) diluted at 1:3000 in blocking buffer diluted 1:3 with PBS is added to each well, except the negative control wells (which are used for background subtraction) and the plate is sealed and incubated overnight at 4°C. Next day, the primary antibody solution is removed and the wells are washed three times with 0.1% TWEEN in PBS, with each wash lasting

5 minutes. 40 μ L/well of secondary antibody (Biotium CF770 goat anti-rabbit 1:2000, catalog number 20078) and DRAQ5 (DNA stain, 5mM, Thermo Scientific, catalog number 62251) diluted at 1:10000 in blocking buffer diluted 1:3 with PBS is then added to all the well, including the negative control wells, and the plate is allowed to incubate on shaker at room temperature for 2 hr. The secondary antibody solution is then removed and the plates are washed three times as described above. The plate is then washed one final time with PBS alone to minimize auto-fluorescence. The plate is then cleaned and read on LiCor Odyssey imager.

[00412] For % response calculations, first divide integrated intensities for 700 channel (ER) by integrated intensities for 800 channel (DNA normalization); 700 (ER)/800 (DNA). This will be referred to as the normalized value. Then subtract average of negative control wells (no primary antibody) from all normalized values. This corresponds to negative subtraction. % response = (Value_{unknown}/ Value_{DMSO control}) *100.

[00413] The data describing the antagonist and degradation properties for the examples is compiled in table 11. The column titled MCF7 IC₅₀ reports the inflection point of the inhibition of transcription in MCF7 cells as described above. Percentage ER α remaining reports the remaining ER α protein measured at 10 μ M concentration of the ligand as described above. The column ER α IC₅₀ reports the inflection point of the degradation in response to the ligand concentration. For example, (E)-3-(4-((6-hydroxy-2-(4-hydroxyphenyl)benzo[b]thiophen-3-yl)oxy)phenyl)acrylic acid (example 2), inhibits 50% of the ER α induced transcriptions in MCF7 cells at a concentration of 0.748 μ M and degrades the ER α receptor, at a 10 μ M concentration, by 59%. Half of the observed receptor degradation occurs at a concentration of 0.026 μ M.
