

ABSTRACT

5 The vessel sail comprises a main body (1) provided with an entrance (2) to the interior
of the main body (1), and a pedestal (3), the main body (1) being situated on said
pedestal (3), in which the entrance (2) is arranged on a side of the main body (1), and
also preferably comprises an access element (5) that is exterior to the pedestal (3) to
access said entrance (2), such as an access ladder that extends vertically along the
pedestal (3). It allows for providing a vessel sail in which access to its interior is as simple
and economical as possible, and which is suitable for use on vessels that have explosive
10 atmosphere zones.
