

Device For Fixing The Edge Of A Floor Covering To A Profiled Structure

Abstract

Device for removably securing the edge (1), provided with a profiling, of a floor covering (2) to a profile construction (3) delimiting the floor covering, the profile construction being in particular a step nosing profile (3) with an angular step profile (7) and a base profile (9) which can be secured on a step (8) and the angular step profile (7) having a step leg (10) with a covering wing (11) and a stop leg (12), characterised by an interchangeable insert (4) which is configured as a profile rail and is arranged such that it can be removed and can be adapted in its position to the profile construction (3) and on which is configured, at least on one of its two mutually opposite longitudinal edges, a retainer (6) which cooperates with the profiling (5) of the edge (1) of the floor covering (2) and is configured to be at least partly complementary to the profiling (5).
