

ABSTRACT

DATA ACQUISITION METHOD, DATA ACQUISITION APPARATUS, AND
RECORDING MEDIUM

A data acquisition program, a data acquisition method,
5 and a data acquisition apparatus, which enable data of a
targeted part to be extracted and output even if specific
tag information is not available, are provided. The data
acquisition program causes a computer (100) to execute a
process of: identifying a position of a part to be
10 extracted in a document that is associated with a specific
URL and includes structural information of tags, the
position being on a hierarchical structure of the tags
included in the document; and allowing the position on the
hierarchical structure to be registered (131). Further,
15 the data acquisition program causes the computer (100) to
execute a process of: periodically or non-periodically
accessing the document associated with the specific URL
(132); and extracting and outputting data corresponding to
the registered position on the hierarchical structure of
20 the tags (133, 134).
