

GRAPHICAL USER INTERFACE SYSTEM FOR QUALITY CONTROL

CROSS-REFERENCE TO RELATED APPLICATION

[0001] This application claims priority to U.S. Provisional Application No. 63/479,068, filed January 9, 2023, the entirety of which is incorporated herein by reference.

TECHNICAL FIELD

[0002] The present application relates generally to computers and computer applications, and more particularly to a graphical user interface and a display method for displaying user interactive items on the graphical user interface. The present application further relates to user interface modules configured to guide a user or operator in the preparation and performance of one or more laboratory procedures, such as an assay.

BACKGROUND

[0003] In various applications including without limitation bioanalytical, chemical analytical, radiological analytical, other sciences (e.g., the biosciences and bioanalytical work), and industrial processes, leading into the use of instrumentation for scientific testing (e.g. biological testing, bioinstrumentation) and equipment for industrial processing, the present disclosure improves testing, analysis, and processing with the aid of integration between consistent software interfaces at various process locations and instrumentation and equipment associated with the processes.

[0004] Often, computer systems and/or applications utilize a series of menus or the like that are presented to a user for receiving input in order to perform their functions. Upon a user selecting an option or making a choice from a list of menu items, a computer system and/or application may perform its function based on the selected option, and/or present another list of menu items (for example, a list of sub menu items that depend on the selected option). The computer system and/or application continues with this process of performing its menu-driven functions, for instance, until the function is completed. In such a menu-driven system, it is often the case that an option that is previously selected, on which the current functioning of the computer system and/or application depends is not visible on the user interface. Thus, for example, the path of menu items taken is not visible at a current point in the computer system and/or application process. Moreover, not only the taken path, but also the options in the path that were not selected also may not be visible on the user interface. Thus, an improved user interface may be desirable.

[0005] Often instrumentation, for example and without limitation, bioinstrumentation, used with analytical applications is used in laboratories whereby the data generated by the instrumentation is stored as data files on a shared network drive for post-processing and import into other electronic systems —namely, a Laboratory Information Management System (LIMS). Typically, these integrations require extensive and time-consuming software development and integration to provide the generated data to end users. Typically, these data integrations are in regulated environments (e.g., 21 CFR Part 11) requiring the generated data to be stored in such a way as to ensure the generated data may not be altered by end users. Also, these integrations are provided to end-users to support post-processing of the generated data for supplemental analysis, reporting, and sharing with other end-users, often referred to as collaborators. Additionally, the use of instrumentation and the post-processing of generated data is desired to be performed under a controlled, uniform, unified, and traceable process within a collection of end-users working closely together, aiding them in creating consistent and correct supplemental analysis and reports. The use of instrumentation to generate data for supplemental analysis and reports typically requires end users to use consumables (e.g., bioconsumables, including without limitation reagents and analytes) with lot-specific information in conjunction with their sample(s) under test to create reactions to be measured to produce the generated data with the lot-specific information used in the generation of supplemental analysis and reports. To obtain these consumables requires purchase of the consumables from provider(s) who must not only ship the physical consumables to the end user, but also provide lot-specific information for those shipped consumables so that the end user may use the consumables on the instrumentation and perform the desired post-processing. Beyond normal use of instrumentation and associated consumables, there is usually a significant support function to ensure the instrumentation and/or associated consumables are performing optimally for a customer at all times. The level of workflow integration required to optimally perform the collective and collaborative work associated with using instrumentation by end users is extremely high, as well as complicated, requiring a user interface that is simple and easy to use, guiding a user through all of the complexities of their analytical workflow. Thus, an improved analytical computing system and user interface associated with and including instrumentation and associated consumables may be desired.

[0006] Additional fields beyond that of instrumentation face difficulties similar to those described above. For example, in various manufacturing settings, the integration of workflows,

tracking of parts, tracking of consumables, tracking of work-in-process, documentation of processes and part production, and all of the issues described above with respect to instrumentation are difficulties. In addition, the present application provides solutions to areas of consumer needs for organization, prioritization, and improvement in workflow in, e.g., business, office, home, travel, and leisure situations. Other examples exist and the solutions disclosed herein are not limited to the problems discussed above.

BRIEF SUMMARY

[0007] In embodiments, a method executed by at least one processor for providing guidance through a graphical user interface (GUI) to assist with the completion of one or more steps of a process is provided. The method includes receiving, by at least one processor, a first command to select an experiment comprising one or more steps to be performed on an instrument or other equipment; providing, by the at least one processor, a second command to display at least a subset of the one or more steps of the experiment on a UI display; and providing, by the at least one processor, a third command, to instruct the instrument or other equipment to at least partially carry out the one or more steps of the experiment.

[0008] In further embodiments, a system for providing guidance through a graphical user interface (GUI) to assist with the completion of one or more steps of a process is provided. The system includes at least one processor; a user input device; and a computer readable storage medium configured to store a computer application, wherein the at least one processor is configured to execute instructions of the computer application for processing. The steps include receiving, by the at least one processor, a first command to select an experiment comprising one or more steps to be performed on an instrument or other equipment; providing, by the at least one processor, a second command to display at least a subset of the one or more steps of the experiment on a UI display; and providing, by the at least one processor, a third command, to instruct the instrument or other equipment to at least partially carry out the one or more steps of the experiment.

[0009] In further embodiments, a computer readable storage medium for providing guidance through a graphical user interface (GUI) to assist with the completion of one or more steps of a process is provided. The storage medium is configured to store a computer application and at least one processor is configured to execute instructions of the computer application. Processing steps of the computer application may include receiving, by at least one processor, a first command to select an experiment comprising one or more steps to be performed on an instrument or other

equipment; providing, by the at least one processor, a second command to display at least a subset of the one or more steps of the experiment on a UI display; and providing, by the at least one processor, a third command, to instruct the instrument or other equipment to at least partially carry out the one or more steps of the experiment.

[0010] In a further embodiment, a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI) is provided. The method includes: providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide for the establishment of at least one criterion to be applied against one or more experiments.

[0011] In a further embodiment, a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI) is provided. The method includes providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to create, organize, and/or aggregate data related to one or more experiments.

[0012] In a further embodiment, a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI) is provided. The method includes: providing, by at least one processor, a first command for a first menu of one

or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to review and/or analyze data related to one or more experiments.

[0013] In a further embodiment, a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI) is provided. The method includes: providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to manipulate data related to one or more experiments

[0014]

[0015] Further features as well as the structure and operation of various embodiments are described in detail below with reference to the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

[0016] FIG. 1 is a method of displaying interactive items on a user interface display for computer-user interaction in one embodiment.

[0017] FIGS. 2A-2O illustrate sample graphical user interface displays in one embodiment.

[0018] FIG. 2P illustrates an example of a methodical user interface including an advanced context menu in accordance with an embodiment hereof.

[0019] FIG. 3 is a flow diagram illustrating a method of interactively displaying interactive items on a user interface display for computer-user interaction in another aspect.

[0020] FIG. 4 is a flow diagram illustrating a user login interface for an assay system in one embodiment.

[0021] FIG. 5 is a flow diagram illustrating a method of displaying a start user interface screen display in one embodiment.

[0022] FIG. 6 is a diagram illustrating a workflow of a define assay method screen in one embodiment.

[0023] FIG. 7 is a diagram illustrating a user interface workflow for selecting an assay method in one embodiment.

[0024] FIG. 8 is a flow diagram illustrating a workflow of a user interface displayed for defining samples in one embodiment.

[0025] FIG. 9 is a flow diagram illustrating a workflow of a user interface displayed for confirming a run definition in one embodiment.

[0026] FIG. 10 is a flow diagram illustrating a workflow of a user interface displayed for notifying the user of the accomplished tasks in one embodiment.

[0027] FIG. 11 is a flow diagram illustrating a workflow of a user interface displayed for an execute/collect option in one embodiment.

[0028] FIG. 12 is a flow diagram illustrating a workflow of a user interface displayed for an execute/prepare option in one embodiment.

[0029] FIG. 13 is a flow diagram illustrating a workflow of a user interface displayed for an execute/load option in one embodiment.

[0030] FIG. 14 is a flow diagram illustrating a workflow of a user interface displayed for an execute/run option in one embodiment.

[0031] FIG. 15 is a flow diagram illustrating a workflow of a user interface displayed for an execute/unload option in one embodiment.

[0032] FIG. 16 is a flow diagram illustrating a workflow of a user interface displayed for an execute/review option in one embodiment.

[0033] FIG. 17 is a flow diagram illustrating a workflow of a user interface displayed for an execute/review option in one embodiment.

[0034] FIG. 18 illustrates components of a graphical user interface (GUI) system in one embodiment.

[0035] FIG. 19 illustrates a schematic of an example computer or processing system that may implement the graphical user interface system in one embodiment.

[0036] FIG. 20 is an example screen shot of a screen displaying a graphical wheel/slider, which maximizes screen black space, in one embodiment.

[0037] FIG. 21 illustrates a cloud-based analytical computing system in an embodiment.

[0038] FIG. 22 illustrates a system architecture for a cloud-based analytical computing system in an embodiment.

[0039] FIG. 23 illustrates a system architecture for a cloud platform in a cloud-based analytical computing system in an embodiment.

[0040] FIG. 24 illustrates interactions between administrator computers and a cloud platform in an embodiment.

[0041] FIG. 25 illustrates interactions between analytical user computers and a cloud platform in an embodiment.

[0042] FIG. 26 illustrates interactions between data integration computers and a cloud platform in an embodiment.

[0043] FIG. 27 illustrates interactions between support user computers and a cloud platform in an embodiment.

[0044] FIG. 28 illustrates interactions between support data integration computer and a cloud platform in an embodiment.

[0045] FIG. 29 illustrates interactions between a consumable information upload computer and a cloud platform in an embodiment.

[0046] FIG. 30 illustrates interactions between an account information upload computer and a cloud platform in an embodiment.

[0047] FIG. 31 illustrates interactions between an instrument information upload computer and a cloud platform in an embodiment.

[0048] FIG. 32 illustrates interactions between a coordinated-operation instrument computer and a cloud platform in an embodiment.

[0049] FIG. 33A illustrates interactions between an individual-operation instrument computer and a cloud platform in an embodiment.

[0050] FIG. 33B illustrates interactions between a workflow-aid instrument computer and a cloud platform for the embodiment shown in FIG. 33A.

[0051] FIG. 34A illustrates a first part of a software architecture for cloud platform services in an embodiment.

[0052] FIG. 34B illustrates a second part of the software architecture for the cloud platform services for the embodiment shown in FIG. 34A.

[0053] FIG. 35A illustrates a logical design for system data in an embodiment.

[0054] FIG. 35B illustrates a mapping of business entities to an account using an analytical computing system in an embodiment.

[0055] FIG. 35C illustrates a logical design of team data relating to plate data in an embodiment.

[0056] FIG. 35D illustrates a logical design of team data relating to assay method data in an embodiment.

[0057] FIG. 35E illustrates a logical design of team data relating to run data in an embodiment.

[0058] FIG. 35F illustrates a logical design of team data relating to experiment data in an embodiment.

[0059] FIG. 36A illustrates an exemplary structure of accounts for users of an analytical computing system in an embodiment.

[0060] FIG. 36B illustrates the flow of the creation of an account for a user of an analytical computing system in an embodiment.

[0061] FIG. 36C illustrates the flow of an association of instruments with an account for a user of an analytical computing system in an embodiment.

[0062] FIG. 36D illustrates the flow of associating consumables with an account for a user of an analytical computing system in an embodiment.

[0063] FIG. 37 illustrates the modules in an administrator software application in an embodiment.

[0064] FIG. 38A illustrates the flow for an admin console module in an administrator app for an account administrator in an embodiment.

[0065] FIG. 38B illustrates the flow for an admin console module in an administrator app for a team administrator in an embodiment.

[0066] FIG. 38C illustrates the flow for a user's login process in an embodiment.

[0067] FIGS. 38D-38H provide screenshots illustrating aspects of the work-experience flow illustrated in FIG. 38A.

[0068] FIG. 38I presents an illustration of an advanced context menu associated with an admin console module.

[0069] FIG. 39A illustrates the flow for an admin audit trail module in an administrator app in an embodiment.

[0070] FIGS. 39B-39E illustrate aspects of an admin audit trail module user interface consistent with embodiments hereof.

[0071] FIG. 40 illustrates the modules in an analytical user software application in an embodiment.

[0072] FIG. 41 illustrates the flow for an analysis method module in an analytical user app in an embodiment.

[0073] FIG. 42A illustrates the design flow for an assay method module in an analytical user app in an embodiment.

[0074] FIG. 42B illustrates the review flow for an assay method module in an analytical user app in an embodiment.

[0075] FIG. 43A illustrates the design flow for an experiment module in an analytical user app in an embodiment.

[0076] FIG. 43B illustrates the review flow for an experiment module in an analytical user app in an embodiment.

[0077] FIGS. 43C-43H illustrate aspects of a reader module user interface consistent with embodiments hereof.

[0078] FIG. 44 illustrates the flow for an audit trail module in an analytical user app in an embodiment.

[0079] FIG. 45 illustrates the modules in a coordinated-operation instrument software application in an embodiment.

[0080] FIG. 46 illustrates the flow for an operation module in a coordinated-operation instrument app in an embodiment.

[0081] FIG. 47 illustrates the flow for a maintenance module in a coordinated-operation instrument app in an embodiment.

[0082] FIG. 48 illustrates the modules in an individual-operation instrument software application in an embodiment.

[0083] FIG. 49A illustrates the flow for an operation module in an individual-operation instrument app in an embodiment.

[0084] FIG. 49AA illustrates the flow for an operation module in an individual-operation instrument app in another embodiment.

[0085] FIG. 49B illustrates the flow of results review in an operation module relating to a plate reader as an individual-operation instrument app in an embodiment.

[0086] FIG. 50 illustrates the modules in a workflow-aid instrument software application in an embodiment.

[0087] FIG. 51 illustrates the flow for a workflow-aid module in a workflow-aid instrument app in an embodiment.

[0088] FIG. 52 is an embodiment of the computing flow of a software automatic update for analytical user computers

[0089] FIG. 53 is an embodiment of the computing flow of a software automatic update for analytical instrument computers.

[0090] FIG. 54 is an embodiment of an example of a non-bioanalytical use of the disclosed architecture for software modules in a chef app.

[0091] FIG. 55 is an embodiment of a user experience flow through a meal planner module beginning with chef app.

[0092] FIG. 56 illustrates a system for implementing a methodical user interface according to an embodiment.

[0093] FIG. 57 illustrates a process for navigating a hierarchical menu tree via a user interface.

[0094] FIGS. 58A-58HH are example non-limiting embodiments of a reader module.

[0095] FIGS. 59A-59T are example non-limiting embodiments of an experiment module.

[0096] FIGS. 60A-60I are example non-limiting embodiments of a maintenance module.

[0097] FIGS. 61A-61Q are example non-limiting embodiments of an admin console module.

[0098] FIGS. 62A-62P are example non-limiting embodiments of generic screenshots applicable to multiple modules herein.

[0099] FIG. 63 is an example non-limiting embodiment of an audit trail module.

[00100] FIGS. 64A-64RR are examples of non-limiting embodiments of an assay method module.

[00101] FIG. 65 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00102] FIG. 66 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00103] FIG. 67 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00104] FIG. 68 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00105] FIG. 69 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00106] FIG. 70 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00107] FIG. 71 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00108] FIG. 72 illustrates a UI display consistent with a collect and prepare module in an embodiment.

[00109] FIGS. 73 illustrates a laboratory system configured for implementation

[00110] FIG. 74 illustrates a UI display consistent with an assay guide module in an embodiment.

[00111] FIG. 75 illustrates a UI display consistent with an assay guide module in an embodiment.

[00112] FIG. 76 illustrates a UI display consistent with an assay guide module in an embodiment.

[00113] FIGS. 77(a)–(c) illustrate a UI display consistent with instrument submodules of assay guide modules in an embodiment.

[00114] FIG. 78 illustrates a UI display consistent with an QC Criteria module in a first embodiment.

[00115] FIG. 79 illustrates a UI display consistent with an QC Criteria module in a second embodiment.

- [00116] FIG. 80 illustrates a UI display consistent with a Project module an embodiment.
- [00117] FIG. 81 illustrates a UI display consistent with a Project module in an embodiment.
- [00118] FIG. 82 illustrates a UI display consistent with a Project module in an embodiment.
- [00119] FIG. 83 illustrates a UI display consistent with an Analysis module in a first embodiment.
- [00120] FIG. 84 illustrates a UI display consistent with an Analysis module in a second embodiment.
- [00121] FIG. 85 illustrates the UI display displaying a Dashboard of a particular project, according to an embodiment.
- [00122] FIG. 86 illustrates the UI display with a "Results" menu item selected, according to an embodiment.
- [00123] FIG. 87 illustrates the UI display with a "Charts" menu item selected, according to an embodiment.
- [00124] FIG. 88 depicts the UI display with a "Controls" menu item selected, according to an embodiment.
- [00125] FIG. 89 depicts a portion of the UI display of FIG. 85 with the "Dashboard" menu item selected.
- [00126] FIG. 90 depicts the UI display with an "Add Assays" option selected, according to an embodiment.
- [00127] FIG. 91 depicts a "Data Table" view under the "Review" menu item, according to an embodiment.
- [00128] FIG. 92 depicts the UI display displaying a prompt for the user to enter a reason for a particular re-run, according to an embodiment.
- [00129] FIG. 93 depicts the UI display with the assays to be re-run displayed, according to an embodiment.
- [00130] FIG. 94 depicts the UI display with a warning displayed, according to an embodiment
- [00131] FIG. 95 depicts the UI display with the Dashboard view for a project, according to an embodiment.
- [00132] FIG. 96 depicts the UI display with all samples/assays marked for re-run, according to an embodiment.

[00133] FIG. 97 depicts the UI display displaying a re-run review view, according to an embodiment.

[00134] FIG. 98 depicts the UI display displaying a select assay view, according to an embodiment.

[00135] Fig. 99 is a flowchart of an example method for conducting one or more experiments.

DETAILED DESCRIPTION

[00136] Embodiments described herein provide technical solutions to various technical problems via improvements to existing technologies and the creation of wholly new technologies. Among the technical problems addressed by embodiments discussed herein include inefficiencies of conventional user interfaces and difficulties in integrating disparate portions of a process workflow.

[00137] Improvements to user interfaces discussed herein provide practical applications of technical solutions to problems in conventional user interfaces related to user inefficiency, accuracy, repeatability, and computing inefficiency. The technical solutions provided herein improve each of these aspects through the use of inventive user interface methods and techniques. In particular, technical solutions provided by user interfaces disclosed herein provide users with more efficient means of navigating through menu systems for complex processes.

[00138] User interfaces for electronic devices, implemented for human-computer interactions or communications, often include a series of menus or like choice options, which a user selects (e.g., choose a series of options in a hierarchical manner) in order to have a computer or like device perform a desired function. In some embodiments, depending on types of applications, the amount of information or the number of menu choices presented to the user can become overwhelming. A wide range of available menu options can cause the user to try different choices or navigate to various menu selection hierarchies, before finding a correct or desired series of choices. In some instance, out of 100% of user interface choice and functionality options available to the user, only about 10% are used. However, presented with all of the 100% of the options, the user may have difficulty in deciding where to navigate to in order to find that 10% which is relevant to the user. Also, because a selected menu choice affects the next choice to be made down a path of menu choices, a user switching between choices will mean that the user also navigates to a number of different paths leading from that choice. Such trial and error, in scrolling and paging through many

different options, which may occur during user interface navigation, is time consuming, costly and inefficient.

[00139] Systems, methods and techniques in the present disclosure may provide a user interface that guides a user through choice options to be selected via a user interface display or another presentation device, with less time to find a correct selection. In this way, fewer attempts are made at incorrect selections, and shorter amounts of time in user navigation is taken to complete a desired computing function or goal. In aspects, a user interface in the present disclosure may present the user with a selective limited number of options out of all available options in a specific manner, and guide the user through those options, streamlining operations and providing the user to be able to focus on reaching a desired computing functionality more efficiently. In another aspect, a user interface in the present disclosure can more directly connect the user to an application.

[00140] The embodiments and technical solutions provide practical applications of specific visual principles to aid users in navigating the menus and systems described herein. Such visual principles include the minimization of visible content and maximization of background or void space so as to reduce visual clutter and emphasize the area of interest. By providing a dark or otherwise uniform background and increasing contrast between the content and background, the user's attention can be drawn to the appropriate areas.

[00141] The embodiments and technical solutions provide practical applications of specific design principles to aid users in navigating the menus and systems described herein. Design principles embodied herein include, for example, minimizing a number of menus and/or selections a user must navigate at any one time.

[00142] Further design principles include presenting a user with a single new choice at any given time while providing optionality for revisiting previously made choices with ease. This principle may be implemented via a two portion display system. An active portion may be configured to display a current user choice, while an historical portion is configured to display information related to previous choices. Together, the active portion and the historical portion may provide a "direct workflow mode." The active portion presenting the current user choice may have a hard limit on the number of menu items displayed, e.g., seven, five, three (or any other number), while other potential items from the same menu are displayed elsewhere. Previously selected choices (and menus from which those selections were made) may be displayed to a user

in a nested fashion or a stacked fashion. A nested fashion series of previously navigated menus may be presented in the manner of Russian nesting dolls (matryoshka), with each previously selected menu item being expanded upon in a displayed submenu. The nested or stacked previously selected menu items may also provide a breadcrumb trail illustrating to a user the pathway taken to arrive at the current menu. In certain embodiments, an indicator bar can be provided to draw a user's attention to the previously selected menu items. For example, when the previously selected menu items are arranged in a stacked fashion, the indicator bar can be used to help vertically align one or more menus and/or menu items. This is illustrated, for example, in FIG. 61D. In this example, the indicator bar (located below the "Add/Remove" item), helps to draw the user's attention to and align the following items: "Manage," "Legal, and "Add/Remove." In certain embodiments, the indicator bar can be depicted to resemble a watch hand, as illustrated in FIG. 61D. Moreover, the indicator bar can include color-coded states (e.g., red to indicate an error state and blue to indicate a non-error state). In certain embodiments, the color-coded state can be depicted within a portion of the indicator bar by illuminating pixels of one or more colors. In one example, the color-coded state can be provided within the middle portion of the indicator bar as illustrated in FIG. 61D, although this state can be displayed in other portions of the UI display as well.

[00143] Embodiments herein maintain a consistent look throughout the use of an interface, regardless of a task or process to be completed, for example by maintaining consistent screen locations for menus so a user does not have to search different locations for menu. In other words, relevant menus are moved to active portions of the screen to bring them to the user's attention as they are needed. In embodiments, the active portion of the screen remains centered top to bottom and left to right. In further embodiments, the size and shape of the menuing interface is altered according to a device or screen on which it is viewed. Menus may be spread horizontally on wider screens and/or spread vertically on taller/narrower screens.

[00144] Embodiments discussed herein improve user productivity by providing efficiency and accuracy improvements through enhancement of several aspects of the user experience. User interfaces described herein focus the user on the most-likely use cases while minimizing distractions caused by lesser utilized options. Such a focus permits the user interface to minimize visual distractions and keep the user focused on the most relevant menu choices. User interfaces described herein seek to lead the user through the user interface from one step to the next while

eliminating sticking points where a user may wonder what to do next. In embodiments herein, the navigational path of the user through the interface system remains transparent to the user to facilitate selecting alternative options or backing out of a current menu. Throughout the process of using the user interface, a user may have the option of viewing, in a non-distracting way, alternative pathways through the process. Accordingly, a core function of the user interface software as provided herein is to reduce the total amount of information presented to the user at any one time while increasing the total amount of relevant information presented to the user at any one time. Additional information and options, for low use cases, remain available in a non-distracting presentation style. Such decisions, regarding what information to present through the user interface at any given time may be guided in advance through predetermined menu workflows and/or may be influenced and updated through analysis of prior user actions and choices.

[00145] Computer functionality may also be improved via embodiments provided herein. For instance, by focusing on a limited number of options, resource usage of devices (e.g., user devices and/or server devices) which may be involved in running the user interface can be reduced. For instance, memory usage, processor resources usage such as a central processing unit (CPU) usage, hard drive or like persistent storage usage, bandwidth needed for communications between devices (e.g., device to device, device to server, server to server), may be reduced. An ability to directly navigate to or reach correct selections or a path of selections, for example, without many trial and error navigations, can also increase communications efficiency between devices and servers, for instance, decrease internet communications and cost associated with such communications.

[00146] Further embodiments discussed herein relate to the integration of various process workflow aspects. As discussed herein, “process workflow” may relate to instrumentation (including bioinstrumentation) testing workflows, manufacturing workflows, analysis workflows, and/or any workflow that may involve one or more pieces of equipment controlled, at least partially, by one or more computing systems. In additional embodiments, process workflows consistent with embodiments discussed herein may include the use of one or more consumables.

[00147] Computing systems consistent with the user interfaces and process workflow management systems discussed herein may include various architectures, including but not limited to single computing device systems, desktop computing systems, laptop computing systems, tablet computing systems, mobile device computing systems, thin client computing systems, cloud based computing systems, server computing systems, multiple device computing systems, device/printer

systems, device/server computing systems, systems including multiple devices and server(s), or any other suitable computing system.

[00148] The process interface systems described herein serve to increase user accuracy, efficiency, and satisfaction by providing a user interface that is faster to use, reduces time to find correct menu items, reduces selection of incorrect menu items, decreases overall workflow time. As compared to traditional systems that may provide immediate access to 100% of options, of which only 10% are frequently used, systems described herein may provide immediate access to only those functions that are frequently used (e.g., in 50, 55, 60, 65, 70, 75, 80, 85, 90, 95, 95+%, 70-95+%, 80-95+% of use cases.) In turn, the solutions provided herein serve to increase computing efficiency, decrease memory usage, decrease utilization of CPU, hard drive, power, and communications resources.

[00149] User interface systems discussed herein may be provided in the form of graphical user interfaces (GUIs), text-based user interface systems, virtual, augmented, or mixed reality (VAMR) interface systems, projection based systems, gesture controlled systems, and/or any other type of visual user interfaces. Collectively, user interface systems, consistent with embodiments hereof may be referred to as “methodical user interfaces” (MUIs). MUIs may include graphical user interfaces (GUIs), text-based user interface systems, virtual, augmented, or mixed reality (VAMR) interface systems, projection based systems, gesture controlled systems, and/or any other type of visual user interfaces. Although some of the principles discussed herein are discussed specifically with respect to, for example, a GUI, no limitation is intended, and the principles discussed herein may equally be applied to other interface systems.

[00150] MUIs described herein refer to “displays,” “interfaces,” and “user interfaces.” As used herein, unless stated otherwise, the terms “display,” “interface,” and “user interface,” refer to the text, images, visual components, interactive elements, and any other visual aspects that are shown or displayed on a screen, projection, or other visual display hardware. It is thus understood that “displays” and “interfaces,” as used herein, may be provided via any type of visual display hardware, screen(s) and/or projector. For convenience, menus, interfaces, and other visual items are referred to herein as being viewed on a MUI or displayed by a MUI. It is understood that such references indicate that the MUI is visually presented via hardware devices as discussed herein.

[00151] As described in greater detail below, user interface systems described herein may use various visual components for presenting menu items. For example, visual components may

include vertical “wheels” or horizontal wheels that rotate through various menu items. The use of a “wheel” as a visual component, as described herein, refers to the way in which prominent (emphasized) and receded (deemphasized) options are presented to the user. Wheel-type visual components can be understood as a virtual wheel with the rim facing the user and with multiple menu items disposed on the rim of the virtual wheel. Wheel-type visual components may or may not include any visual indicators of the presence of a wheel. Wheel-type visual components may present a prominent option to the user in a way that draws attention (i.e., on the portion of the wheel “closest” to the user) while other, receded options, are presented in a way that does not draw attention. Prominent menu items may be highlighted in a different color, presented in a different font, presented in a larger font, or otherwise visually marked to draw attention. As the virtual wheel is rotated, the currently prominent menu item rotates away from the user (either clockwise or counterclockwise) and a currently receded menu item becomes the new prominent option. In embodiments, the receded menu items closest to the prominent menu item may be displayed to draw more attention than receded menu items further from the prominent menu item. For example, menu items may decrease in size or brightness based on their distance from the currently prominent menu item. As the “wheel” is “rotated,” receded menu items may fade from view. In this fashion, the virtual wheel provides the user with the sense and feel that the menu items are all disposed on an actual wheel. Visual components may further include horizontal or vertical sliders that slide through various menu items. Similarly, to wheels as discussed above, sliders may be used to provide a prominent menu item and receded, or less prominent menu items. In embodiments, sliders may differ from wheels in that receded menu items do not appear to fade from view as the options in the slider are slid through. Further embodiments of wheels and sliders are discussed further herein with respect to specific embodiments.

[00152] As discussed herein, menu items may variously be “selected,” “highlighted,” and/or “clicked.” As used herein, “highlighting” a menu item means that the “highlighted” option is prominently displayed to the user, for example, as a prominent menu item in the center of a wheel. “Highlighting” may include changing the color, size, font, etc., of a menu item to visually emphasize the menu item to the user. “Dehighlighting” a user option may include changing the color, size, font, etc., of a menu item to visually deemphasize the menu item to the user. A menu item may be highlighted or dehighlighted (e.g., by presenting a menu item not available for selecting or editing by a user) in response to user action (e.g., via clicking a mouse, touching a

touch screen, spinning a wheel, etc.) and/or may be highlighted or dehighlighted based on an action of the interface (e.g., by presenting a highlighted default option).

[00153] As used herein, “selecting” a menu item means that a menu item has been chosen by the user and that the user interface has proceeded with one or more menu steps in accordance with the selection. “Selecting” a menu item causes the computer system to execute computer instructions to advance the menu beyond simply “highlighting” the menu item. For example, “selecting” a menu item may cause a new menu to be displayed based on the selection. Selected menu items may be highlighted after selection but highlighting of a menu item does not necessarily include selecting the menu item.

[00154] In some embodiments, a menu item may be selected or highlighted via clicking on the menu item. As used herein, “clicking” refers to the user action of clicking, tapping, or otherwise using an interface device (e.g., mouse, touchscreen, etc.) to indicate or choose a menu item. “Clicking” a menu item, as used herein, differs from “selecting” a menu item. Clicking refers to the user action of indicating a menu item, while selecting refers to the computer functionality associated with the selection of the menu item.

[00155] In some embodiments of a system in accordance herewith, a menu item may be selected through clicking. Clicking on a menu item may cause the system to advance to the next series of menu items. In other aspects of the disclosed system, clicking a menu item serves to highlight the menu item, but does not select it to advance the system to the next menu item.

[00156] Menu items may be described herein as “selectable.” A “selectable” menu item refers to a menu item that a user can interact with, either through selecting it or highlighting it. Selectable menu items may be displayed in a fashion that indicates that they are selectable, through changes in coloring, highlighting, fonts, etc. Menu items may be described herein as “unselectable.” “Unselectable” menu items refer to menu items that a user cannot currently interact with through selection or highlighting. Unselectable menu items may be displayed in a fashion that indicates that they are unselectable, through changes in coloring, highlighting, fonts, etc.

[00157] Menu items may also be described as “past selected” and “past unselected.” A “past selected” menu item refers to a menu item that was selected to arrive at the current menu interface display. It is not required that a “past selected” menu item have been actively selected by a user. If the system, by programmed default, brings a user to a menu level below a top level, a menu item or choice in the current pathway may be indicated as “past-selected,” even if a user has not actively

selected it during the current session. A “past unselected” menu item refers to a menu item that was not selected to arrive at the current menu interface display. For example, where a user has selected a first menu item and has not selected a second menu item, the system may proceed to display a subsequent menu or submenu responsive to the selection of the first menu item in an active portion of the MUI. In a historical portion of the MUI, the system may display the first menu item as a past selected menu item and the second menu item as a past unselected menu item. The past unselected menu item may be displayed as selectable.

[00158] For example, a user may scroll a slider or spin a wheel through various menu items. A user may settle the wheel or slider such that a specific menu item has been highlighted. In embodiments, the specific menu item may require further user interaction (e.g., a single or double click) to be “selected,” which causes the MUI to present a new set of menu items or submenu items responsive to the selection. In such an embodiment, a user would spin a wheel or scroll a slider to move a desired menu item to be the highlighted prominent menu item. Then, the user would click, double click, or otherwise indicate approval of the highlighted menu item as a selection to cause the presentation of the next menu or submenu. In embodiments, the specific menu item may be “selected” at the same time that it is highlighted. In such an embodiment, spinning the wheel or scrolling the slider to move the desired menu item to the highlighted prominent menu position would cause the associated submenu to be presented as soon as the desired menu item is highlighted.

[00159] Selection or highlighting a menu item, as discussed herein, may be caused by directly choosing (i.e., clicking, touching, etc.) on the menu item, wherever it may be on a wheel, slider, and/or list of items, regardless of whether it is a prominent or receded menu item. Selection or highlighting a menu item may also occur responsive to user manipulation of various visual components to cause the menu item to move to a position where it is to be highlighted or selected. For example, a user may spin a wheel or move a slider until a particular menu item is prominent and highlighted. Manipulation of visual components and/or direct choosing may be implemented through the use of any suitable user input device, including touchscreens, mice, keyboards, arrow keys, gaze detection system, motion detection systems, gesture detection systems, etc.

[00160] Features of embodiments of the interface may be referred to as a “first portion” and a “second portion.” These terms refer to specific portions of the displayed user interface at various times and are not required to be fixed to specific places on the screen. As used herein, a “first

portion” may also be referred to as an “active portion.” The “first portion” or “active portion” represents the portion of the MUI displaying the most current or newest set of menu items. “First portion” and “active portion” may be used interchangeably herein. The “second portion” may also be referred to as an “historical portion.” The “second portion” or “historical portion” represents the portion of the interface displaying previously viewed menus and previously selected and unselected menu items. “Second portion” and “historic” portion may be used interchangeably herein.

[00161] FIG. 1 illustrates a method of interactively navigating a user through a path of menu choices on a user interface in one embodiment. The method may be performed automatically by at least one hardware processor. The method facilitates moving a user through a system by asking questions, showing past choice or choices the user has made along with other option(s) that were not chosen while drilling down through additional choice(s) based on the initial choice. As used herein, “asking questions” refers to presenting a user with one or more menu choices to select from. The method allows the user to continue down a path or jump to a different path, going back in time to a choice made in one or more earlier step(s) or going back to the latest point at which the user has made a choice. The user interface in one embodiment presents and allows the user to see the past or prior choice(s) that have been made and not made, for example at every step of the path, regardless of where the user is on the path, all on the same screen. The user interface for example, presents an outline of the user’s menu choice path that also includes menu item(s) not chosen. The user interface methodology allows for more efficient navigation, leading the user along a path, allowing the user to see the path the user is going through, and allowing the user to deviate from a path that has been set for the user to a different path. The user interface methodology allows the user to be able to see backward and forward breadcrumb(s), and where the user is going and where the user could go.

[00162] As discussed herein, menus are presented as a series of hierarchical menu trees. Each level of the menu tree includes multiple menus leading to other menus. Accordingly, a first level of the menu tree includes a plurality of first menus, a second level of the menu tree includes a plurality of second menus, a third level of the menu tree includes a plurality of third menus, etc. This structure continues to an execution menu level. In some discussions herein, a first menu is referred to simply as a menu, while subsequent menu layers in the tree are referred to as submenus, sub-submenus and so on. At time, multiple layers of menus below a current menu may be collectively referred to as submenus. Thus, the submenus of a first menu may include a plurality

of second menus, a plurality of third menus, a plurality of fourth menus, a plurality of execution menus, and so on. An example of a hierarchical menu tree structure is illustrated in FIG. 2K. As used herein, with reference to the hierarchical menu tree, each level is referred to as a “menu” even where it does not present a literal menu to the user. For example, a “menu” may present only an “execute” button to implement a process designed throughout other portions of the menu. Another “menu” may present a tutorial, for example.

[00163] Each of the numbered menus includes multiple menu items or choices, with each item or choice pointing to a new menu at a lower level. Thus, the items in a first menu may each point to one of the plurality of second menus. In some embodiments, a menu layer may be skipped. For example, an option in a first menu may point to one of the plurality of third menus.

[00164] In embodiments, each menu may also include, for display in the MUI, additional information. Additional menu information may provide a user information about items in the menu and/or general context regarding the menu. For example, where a menu presents a user with save file options, additional information may be provided that indicates remaining disk space. In another example, where a menu presents a user with options pertaining to assays to be run, additional information may be provided on available consumables related to the displayed assays.

[00165] At the execution menu level, i.e., a last level in a series of menus, a user may select execution menu choices or items. These choices or items do not lead to further menus, but instead represent selections of parameters for the process the menu tree is intended to facilitate. Selection of execution menu choices or items causes the system to perform a function related to the selected menu choices or items. For example, when using an assay design menu tree, execution menu choices may include options such as file name, assay parameters, reagent choices, etc.

[00166] In embodiments, execution menus may facilitate the interface between the MUI software and the physical world. Execution menus may provide, for example, execute commands that are output by the methodical user interface control system 1102 to connected systems or instruments to implement processes that were designed through use of the MUI. In examples, such execute commands may cause manufacturing systems to begin manufacturing parts, may cause assay instruments to begin conducting assays, may cause design systems to transmit design specifications, etc.

[00167] In embodiments, execution menus may provide user walkthroughs or tutorials. For example, after designing a workflow or process, an execution menu may provide a walkthrough

or tutorial coinciding with the workflow, offering text based, audio based, video based, and image based tutorial steps to walk the user through each step of the designed workflow or process.

[00168] In embodiments, execution menus may provide walkthroughs and/or tutorials in conjunction with execution commands issued to physical world instruments and machines. For example, in a modular laboratory system, such a combination may provide instructions to a user to load a machine (e.g., with assay plates and reagents) and then provide execution commands to the machine to run the process. As new steps in the process require physical intervention by the user (moving assay plates, etc.), the MUI, at the execution level, may provide the user with additional instructions (text based, video based, image based, audio based, etc.) to advance the process. In embodiments, user instructions and notifications to implement a user intervention portion of a process may be provided via various communication means, including, for example, text (SMS, MMS), e-mail, phone call, instant message, slack message, and any other type of messaging protocol. Such various communication means may be useful, for example, when portions of the machine processing take some time to complete and a user may not wish to remain at the process location during processing. Accordingly, where a user has initiated a process that takes several hours, they may receive a text message indicating that their intervention is required to advance the process.

[00169] These types of “cobot” interactions, wherein the MUI integrates the physical world actions of both human operators and automated machines may be applied to various processes or workflows, including laboratory workflows, manufacturing workflows, food production workflows (e.g., beer production, bread production, etc.), shipping and logistic workflows (e.g., box filling and picking, packaging, etc.). These automated machines can further include non-human machines, such as robots, drones, robotic-based machines, or other autonomous, or semi-autonomous machines.

[00170] As used herein, “display” of a menu includes display, within the MUI, of one or more items in the menu. Display of a menu does not require display of all items or options in the menu. The menu items or items that make up the first menu remain the same, regardless of whether each menu item is displayed. As discussed in greater detail below, certain menu items may be excluded or limited for various reasons. As discussed herein, a specified “first menu” or “second menu” may be relocated to various portions of the screen. When relocated, the first menu may continue to display the same set of first menu items and/or may display a different set of first menu items.

[00171] As discussed herein, menus may also be referred to based on their temporal status. A “current menu” refers to a menu that is currently active in the active portion of the MUI from which a user is prompted to select an option. A “past menu” refers to a menu from which a user has previously selected options. Past menus may be displayed in the historical portion of the MUI. A “subsequent menu” refers to a next menu that becomes active after the current menu becomes a past menu. For example, a first menu may be displayed as a current menu. After a selection has been made from the first menu, the first menu may then be relocated to become a past menu. A subsequent menu, a second menu indicated by the selection made from the first menu, may then be displayed as a current menu. Current menus may be displayed in the first or active portion of a user interface while past menus may be displayed in the second or historical portion of a user interface.

[00172] In the historical portion, the menu items of each past menu may be displayed in the MUI in a linear fashion. All of the menu items from that menu level are displayed in a single line (horizontal or vertical). Each set of past menu items may be displayed in such a linear fashion while the menus as a whole may be displayed in a stacked or nested fashion. This feature is shown, e.g., in FIG. 2C which shows MENU ITEMS displayed in a linear fashion and SUBMENU ITEMS displayed in a linear fashion. The relationship between the MENU ITEMS and the SUBMENU ITEMS is a stacked or nested relation. Accordingly, among a single menu level, the menu items are adapted to be displayed in a linear fashion while the previously navigated and subsequent menu levels are adapted to be displayed in a nested fashion.

[00173] A menu of choices may be displayed in a graphical wheel that rotates the choices in a direction, for example, horizontal or vertical (for example, left and right, up and down) or another direction. In another aspect, a menu of choices may be displayed as a graphical slider that slides the choices in a direction, for example, horizontal or vertical (for example, left and right, up and down) or another direction. For instance, an initial menu level (first level) may be displayed in the horizontal and slide left and right and the next menu level (second level) may be displayed in the vertical and rotate up and down. Yet in another aspect, menus of choices may be displayed as a series of concentric circles, each menu level displayed as a circle with menu choices (also referred to as options or menu items). For instance, an initial menu level (first level) may be displayed in the center circle, the next menu level (second level) may be displayed in the next circle (second circle) that surrounds the center circle, further next menu level (third level) may be displayed in

yet another circle that surrounds the second circle, and so forth. Still yet, menus of choices may be displayed or visualized as a graphical decision tree with nodes and edges. Each level of the graphical decision tree may represent a menu level with choices.

[00174] In one embodiment, the wheel and/or the slider need not rotate fully, for example, do not make a full revolution or circle around. For instance, the wheel and/or the slider rotates or slides from a beginning menu item to an ending menu item, and back from the ending menu item to the beginning menu item. In this way, for example, the beginning and end of the menu are always apparent because the two do not merge or come together. This technique decreases processing time because the wheel and/or the slider is able to convey (and a user is able to immediately understand) the full menu of choices with clear indication as to where or which is the first menu item and where or which is the last menu item in the choices presented by the wheel and/or the slider.

[00175] In further embodiments, the wheel and/or sliders may rotate fully to permit a user to easily access the beginning of a menu after reviewing the entire menu. In such embodiments, a visual indicator may be provided to indicate that the menu has been rotated through a full rotation and back to the beginning.

[00176] In various embodiments, the terms “software protocol” and “computer instructions” are used to describe software instructions or computer code configured to carry out various tasks and operations. As used herein, the term “manager” refers broadly to a collection of software instructions or code configured to cause one or more processors to perform one or more functional tasks. For convenience, the various managers, computer instructions, and software protocols will be described as performing various operations or tasks, when, in fact, the managers, computer instructions, and software protocols program hardware processors to perform the operations and tasks. Although described in various places as “software” it is understood that “managers,” “software protocols,” and “computer instructions,” as used herein, may equally be implemented as firmware, software, hardware, or any combination thereof for instructing a computer or other electronic device for performing and/or carrying out a series of steps and/or instructions. Furthermore, embodiments herein are described in terms of method steps, functional steps, and other types of occurrences, such as the display of menus, the selection of options, etc. Although not explicitly stated in every instance, it will be understood that these actions occur according to computer instructions or software protocols executed by one or more computer processors.

[00177] Functionality of the managers and software protocols discussed herein may be provided by the issuance of one or more commands. As discussed herein, “commands” issued by managers and software protocols refer to the signals and instructions provided to various aspects of the computing system to cause various actions to occur. Commands may be issued from one manager to another manager and/or may be issued to other components of the system. For example, a manager may provide a command to cause display of certain visual components within a menuing interface. Such a command may be directed towards a physical display screen and may include the required signals and instructions to generate the visual components. As used herein, when a manager is described as performing an action or carrying out certain functionality, it is to be understood that the manager has issued a command to cause such action or functionality to occur.

[00178] In various embodiments, the term “module” is used herein to refer to a specific suite of software protocols and computer instructions to generate, maintain, and operate the multiple components of a MUI as described herein. The one or more processors described herein may be configured to execute multiple software protocols so as to provide a methodical user interface module. As used herein, “methodical user interface module” refers to any of a subset of modules providing specific user interfaces. For example, an admin console module, audit trail module, and reader module are provided as specific methodical user interface modules to carry out tasks related to system administration, auditing, and plate reading, respectively. Each MUI module may be understood to include at least a hierarchical menu tree including multiple layered menus. Each module may further include preferred default visual components, preferred default exclusion and limitation lists, and other features specific to the module. Other modules are discussed in greater detail below and throughout the present disclosure. Throughout the present disclosure, multiple aspects of various MUI modules are discussed. The discussed aspects of any specific MUI module are non-exclusive and non-limiting and may equally be applied to any other MUI module. Accordingly, any MUI feature discussed herein, either broadly or with respect to a specific module, may also be applied broadly to the MUI in general and/or to any other specific MUI module discussed herein.

[00179] Referring now to FIG. 56, a methodical user interface control system 1102 consistent with embodiments hereof is illustrated. The methodical user interface control system 1102 includes one or more processors 1110 (also interchangeably referred to herein as processors 1110, processor(s) 1110, or processor 1110 for convenience), one or more storage device(s) 1120, and/or

other components. The CPU 2 (see FIG. 19) and the hardware processor 1804 (see FIG. 18) may be examples of a processor 1110 configured as described herein. In other embodiments, the functionality of the processor may be performed by hardware (e.g., through the use of an application specific integrated circuit (“ASIC”), a programmable gate array (“PGA”), a field programmable gate array (“FPGA”), etc.), or any combination of hardware and software. The storage device 1120 includes any type of non-transitory computer readable storage medium (or media) and/or non-transitory computer readable storage device. Such computer readable storage media or devices may store computer readable program instructions for causing a processor to carry out one or more methodologies described here. The memory 4 (see FIG. 19) and the memory device 1802 (see FIG. 18) may be examples of a storage device 1120. Examples of the computer readable storage medium or device may include, but is not limited to an electronic storage device, a magnetic storage device, an optical storage device, an electromagnetic storage device, a semiconductor storage device, or any suitable combination thereof, for example, such as a computer diskette, a hard disk, a random access memory (RAM), a read-only memory (ROM), an erasable programmable read-only memory (EPROM or Flash memory), a static random access memory (SRAM), a portable compact disc read-only memory (CD-ROM), a digital versatile disk (DVD), a memory stick, but not limited to only those examples. In embodiments, the storage device 1120 may include multiple storage devices 1120. Multiple storage devices 1120 consistent with embodiments hereof may be collocated and/or non-collocated. For example, one physical system may contain a first memory storage device 1120 and a second physical system may contain a second memory storage device 1120.

[00180] In embodiments, the processor 1110 and the storage device 1120 may be implemented via a cloud computing platform or other form of distributed computing. In such implementations, the processor and the storage device may each include a plurality of processors and storage devices for carrying out the tasks and functions described herein.

[00181] The processor 1110 is programmed by one or more computer program instructions and/or software protocols, referred to as “managers” stored on the storage device 1120. For example, the processor 1110 is programmed by a display manager 1050, an input manager 1052, a menu manager 1054, a user manager 1056, an exclusion manager 1058, a network manager 1060, and a data storage manager 1064. It will be understood that the functionality of the various managers as discussed herein is representative and not limiting. Furthermore, the functionality of

the various managers may be combined into one or more modules, applications, programs, services, tasks, scripts, libraries, applications, or executable code, as may be required.

[00182] The managers as discussed herein may be implemented to manage a MUI in various embodiments to complete various tasks that require process workflows. Although various software implementations of the MUI are described herein with respect to one or more specific embodiments, the methods and functionalities provided by the aforementioned managers may be implemented to provide MUIs for any process workflow. The aforementioned managers may be functionally implemented through software libraries

[00183] The various components of the methodical user interface control system 1102 work in concert to provide a user with a methodical user interface display via any type of display hardware, including screens, projections, touchscreens, headsets, etc. In embodiments, the methodical user interface control system 1102 implements one or more software protocols for interactively navigating a user through path(s) of menu items, options, or choices in a MUI. The software managers described above may include sets of computer instructions, software libraries, dynamic link libraries, application program interfaces, function libraries and other compilations of executable code. The methodical user interface control system 1102 may further include appropriate graphics libraries containing the graphics required to implement and instantiate the various visual components described herein. The managers may be customized for use in a specific implementation through the use of various data structures representative of module information, including tables, linked lists, databases, b-trees, binary trees, heaps, stacks, queues, hash tables, red-black trees, binomial heaps, Fibonacci heaps, and any other suitable data structure. Accordingly, managers of the MUI may be provided as customizable code libraries configured to interface, interact, and otherwise integrate with additional computer instructions and data structures for the purpose of providing a MUI module capable of performing specific tasks.

[00184] The display manager 1050 is a software protocol in operation on the methodical user interface control system 1102. The display manager 1050 is configured to manage the methodical user interface display, including all visual components thereof. Display manager 1050 may be configured to issue commands to cause the display of various menu items as required.

[00185] The input manager 1052 is a software protocol in operation on the methodical user interface control system 1102. The input manager 1052 is configured to manage all inputs received by the methodical user interface control system 1102, including, but not limited to, user inputs and

inputs from other systems. The input manager 1052 may be configured to issue commands to other managers of the methodical user interface control system 1102 according to inputs received. User actions, such as clicking and other screen interactions cause the input manager 1052 to receive a signal indicative of the user interaction. Receipt of such a signal causes the appropriate manager of the methodical user interface control system 1102 to provide a command in response to thereby cause one or more actions, including MUI navigation, menu display, etc., as discussed herein. For ease of explanation, such interactions and user inputs may be referred to as causing a specific response, when in fact the specific response is caused by the methodical user interface control system 1102 responsive to the interaction or user input.

[00186] The menu manager 1054 is a software protocol in operation on the methodical user interface control system 1102. The menu manager 1054 is configured to manage the hierarchical menu trees and all menu items associated with the menu trees. The menu manager 1054 is configured to select appropriate menu items for display, to determine a next menu to display, and otherwise manage all aspects of navigation through a menu tree. The menu manager 1054 may be configured to issue commands to other managers of the methodical user interface control system 1102 according to menu navigational requirements.

[00187] The user manager 1056 is a software protocol in operation on the methodical user interface control system 1102. The user manager 1056 is configured to manage user access to the methodical user interface control system 1102. The user manager 1506, for example, manages user authorization, including the maintenance of user authorization records, the validation of user credentials, and other required user authentication tasks.

[00188] The exclusion manager 1058 is a software protocol in operation on the methodical user interface control system 1102. The exclusion manager 1058 is configured to manage menu item exclusions and limitations. As discussed herein, menu items may be excluded or limited based on various factors. The exclusion manager 1058 may be configured to issue commands to implement such exclusions and limitations.

[00189] The network manager 1060 is a software protocol in operation on the methodical user interface control system 1102. The network manager 1060 is configured to establish, maintain, and manage all network communications between the methodical user interface control system 1102 and various other system components discussed herein. The established communications pathway may utilize any appropriate network transfer protocol and provide for one way or two-

way data transfer. The network manager 1060 may establish as many network communications as required to communicate with all system components as necessary.

[00190] The data storage manager 1064 is a software protocol in operation on the methodical user interface control system 1102. The data storage manager 1064 is configured to store, retrieve, archive, manipulate, and manage all data structures and data storage devices that the methodical user interface control system 1102 may interface with. The data storage manager 1064 is configured to issue commands to any of the various data storage devices discussed herein to manage the storage and retrieval of data.

[00191] The above descriptions of the display manager 1050, input manager 1052, menu manager 1054, user manager 1056, exclusion manager 1058, network manager 1060, and data storage manager 1064 provide an overview of the capabilities and tasks of these managers. The managers are not limited by the above description, and, in various embodiments as discussed below, may have additional, different, and/or more capabilities. The described structure of the methodical user interface control system 1102 is by way of example only, and it is to be understood that the various functionalities and capabilities of the computer instruction programmed processors described herein may be carried out, implemented, or effected by a software system of alternative structure.

[00192] The methodical user interface control system 1102 may present menu choices among one or more hierarchical menu levels, wherein each menu level can include one or more menu items or choices. Hierarchical menu levels, as described herein, refer to the multiple levels in a menuing system. A selection in a first, highest, menu level causes navigation to a lower hierarchical level, i.e., second menu, a submenu, or sub-level. Selection within the second menu or submenu causes navigation to a still lower hierarchical level, i.e., a third menu or sub-submenu or sub-sub-level. Hierarchical menu structures may include any suitable number of levels. In some embodiments, selection at one level may cause navigation to a level one, two, three or more levels below the current level.

[00193] Each menu may present options in an active portion of the interface. The menu choices may be selectable, representing options for the user to select. Selection of a menu choice or option may trigger the display or presentation of a subsequent, following, or submenu, which may include several menu choices or submenu choices of its own. As the user selects menu options, that lead to new menus, the menu items of the old menu may be moved from the active portion to a historical

portion of the interface, allowing the user to easily move to new menu choices while retaining knowledge of previous menu choices. These features are described in greater detail below with respect to FIGS. 2A-2O, FIG. 3, and FIG. 57.

[00194] FIG. 57 is a flow chart showing a process 5200 of navigating a path of hierarchical menu levels adapted for output to a user interface, such as a GUI, MUI, and or any other type of UI discussed herein. The process 5200 is performed on a computer system having one or more physical processors programmed with computer program instructions that, when executed by the one or more physical processors, cause the computer system to perform the method. The one or more physical processors are referred to below as simply the processor. In embodiments, the process 5200 is carried out via the methodical user interface control system 1102 as described herein. The methodical user interface control system 1102 represents an example of a hardware and software combination configured to carry out the process 5200, but implementations of the process 5200 are not limited to the hardware and software combination of the methodical user interface control system 1102. The process 5200 may also be carried out and/or implemented by any other suitable computer system as discussed herein. Description of the process 5200 is not limiting, and the various operations may be altered or revised in accordance with embodiments described herein.

[00195] In an operation 5202, the process 5200 includes providing a first display command. The display manager 1050 provides the first display command for the display of a first menu having one or more user-selectable items to be displayed on a first portion of a UI display. The first menu may be displayed in the first portion according to any of the visual components disclosed herein, for example, a wheel-type visual component. The selectable items of the first menu may be determined, for example, by the menu manager 1054 as discussed herein.

[00196] In an operation 5204, the process 5200 includes receiving a selection. The input manager 1052 receives a selection of a menu item from the first menu according to an input provided to the system. The input may be a user selection and/or may be an automated selection as discussed herein. A user selection may be received, for example, from a user clicking on a highlighted or emphasized menu item. Upon selection, the menu item may be a past-selected menu item.

[00197] In an operation 5206, the process 5200 includes providing a relocation command. The menu manager 1054 provides a relocation command for the first menu to be relocated from the

first portion of the UI display to the second portion of the UI display. The relocation command may be provided responsive to the selection received. Upon relocation, the menu items of the first menu include the one or more past-selected menu item(s) and past-unselected menu item(s) that were not selected to cause the relocation. Display of the first menu in the second portion may be provided according to any of the visual components disclosed herein, for example, a slider-type visual component. The relocation command of the menu manager 1054 may be sufficient to cause an update to the UI display. In another embodiments, the relocation command may be combined with and/or include a display command provided by the display manager 1050.

[00198] In an operation 5208, the process 5200 includes providing a second display command. The second display command is provided by the display manager 1050 responsive to the selection of the menu. The second display command causes a second menu of one or more user-selectable items to be displayed on the first portion of the UI display, i.e., after the first menu has been relocated. The second menu may be displayed according to any of the visual components disclosed herein, for example, a wheel-type visual component. In embodiments, the second display command may incorporate information received from the menu manager 1054 related to hierarchical menu tree navigation. After relocation of the first menu and display of the second menu, the first menu, containing one or more past-selected and past-unselected menu items of the hierarchical menu tree, may be viewed in the second portion concurrently to the second menu being viewed in the first portion.

[00199] The process 5200 may further include additional or different operational steps as described throughout the present disclosure.

[00200] Referring to FIG. 1, at an operation 102, a current menu of choices (e.g., a list of menu items) may be displayed on a first portion of the user interface display. At an operation 104, the user interface allows the user to select a menu item from the current menu of choices displayed on the first portion of the user interface display and to drill down through level(s) of menu choices based on selecting a menu item from a prior level of menu choices. At an operation 106, past selected and past unselected menu item(s) of the drilled-down levels are displayed on a second portion of the user interface display. The past unselected menu items are displayed as selectable options. The past selected menu item (or choice) may be also displayed as a selectable option. At an operation 108, the user interface allows the user to jump to a different path of menu choices by allowing the user to select a past unselected menu item from a previously navigated menu level

displayed on the second portion of the user interface display. The user interface displays both the first portion and the second portion so that they are both viewable on the same screen of the user interface, for example, viewable concurrently.

[00201] In one embodiment, the first portion and the second portion are shifted to substantially center the first portion displaying the current menu of choices on the user interface display while fitting both the first portion and the second portion on the user interface display. Thus, for example, the first portion and the second portion need not remain in a fixed location of the user interface display during the navigating or drilling down (or up) through different levels of menu choices.

[00202] In one embodiment, the user interface responsive to detecting a selection of a menu item from the current menu of choices, relocates the current menu of choices to the second portion of the user interface display, and displays on the first portion of the user interface display a next level of menu choices based on the selection of the menu item. The relocated current menu of choices is shown on the second portion of the user interface display and becomes the past selected and past unselected menu items of a past menu level. The next level of menu choices is shown on the first portion as the current menu of choices.

[00203] As described above, a menu of choices may be displayed as a rotatable graphical wheel showing menu items (choices or options) in which the menu items on the wheel can be shown as the wheel is rotated. A like graphical slider in which the menu items on the slider can be shown as the slider is slid. The action of rotating or sliding may be performed responsive to a motion of a finger on a touch screen or an input from a pointing device or another input device. In another aspect, the action of rotating or sliding may be performed automatically by the user interface (or a hardware executing the user interface) in a timed manner. In one embodiment, the rotating or sliding direction may switch to different orientation as the menu of choices is relocated from the first portion to the second portion.

[00204] The current menu of choices may be displayed in first visual orientation on the first portion of the user interface display and the drilled-down levels of menu choices that include the past selected and past unselected menu items may be displayed on the second portion of the user interface display in second visual orientation.

[00205] In one embodiment, the current menu of choices is displayed as a graphical rotating wheel or a slider that rotates or slides the choices in a direction of the first visual orientation. In

one embodiment, a drilled-down level in the drilled-down levels of menu choices is displayed as a graphical rotating wheel or a slider that rotates or slides choices of the drilled-down level in a direction of the second visual orientation.

[00206] In one embodiment, the second visual orientation is substantially orthogonal to the first visual orientation. In one embodiment, the first visual orientation is a vertical orientation and the second visual orientation is a horizontal orientation. In another embodiment, the first visual orientation is a horizontal orientation and the second visual orientation is a vertical orientation.

[00207] In one embodiment, the drilled-down levels of menu choices relocated to the second portion are displayed as a stack of menu levels.

[00208] In another embodiment, the first portion and the second portion may be displayed as a series of concentric circles. For instance, the first portion may be displayed as the center circle of the series of concentric circles, and the past menu levels as the circles outside or surrounding the center circle. Each circle representing a menu level may include menu items (choices or options) that are rotatable, for instance, in order for the user to be able to view all options present on that menu level. Upon selecting a menu item from the current menu of choices, that current menu of choices is relocated to an outer circle and the center circle displays the next menu of choices based on the menu item that is selected. For instance, a circle (e.g., dial) may include window(s) that show the active option and turning the circle (e.g., dial) shows other options in the window(s). While the dial options seem finite, the dial options may be infinite. For example, the dial keeps spinning until the last option (or beginning option, if turning backward) is shown.

[00209] In another aspect, the window may be opened up to show the selected option as lit up, with one (or more) option to the left and another (or more) option to the right.

[00210] In yet another embodiment, the first portion and the second portion may be displayed as a graphical decision tree.

[00211] In one embodiment, the past selected menu items in the drilled-down levels displayed on the second portion of the user interface display are displayed highlighted relative to the past unselected menu items of the drilled-down levels displayed on the second portion of the user interface display.

[00212] In an embodiment, upon encountering the last level in a chosen path of menu levels, and for example, upon performing a function related to the chosen item in the last menu level, the user interface may return the current menu view to another item in an upper level, for example,

the first menu list. For instance, the current menu of choices may again be the first initial menu level and may be displayed in the first portion. In an embodiment, the first and second portions are not independent, but linked to each other to make navigation more efficient, leading the user along a path, allowing the user to see the path the user is going through, and allowing deviation from the path that has been set for the user to a different path, for example, being able to see backwards and forwards breadcrumbs to be able to see where the user has been and where the user may go in a path of menu choices. The user interface in one embodiment is able to guide the user, through efficient path choices such that the user need not wander about the user interface trying to find the next appropriate path or action. Such efficient path guidance allows for saving computer resources, for instance, in central processing unit (CPU) cycles and memory usage spent in swapping in and out of processor threads and memory elements in a computer running the user interface.

[00213] Referring now to FIGS. 18-19, additional example systems for carrying out the methods described with respect to FIG. 1 are provided. As discussed above, aspects of the systems presented in FIGS. 18 and 19 may be embodiments and/or implementations of the methodical user interface control system 1102 shown in FIG. 56.

[00214] FIG. 18 illustrates components of a graphical user interface (GUI) system in one embodiment. One or more hardware processors 1804 may execute a graphical user interface module and perform the graphical user interface functions described above, displaying the graphical elements as described above on a user interface display device 1806 coupled to the one or more hardware processors 1804. A memory device 1802 may store a list of menus and a list of menu items or choices available for each of the list of menus, which the graphical user interface module may access to display on the display device 1806. The display device 1806 may include a screen device and/or a touchscreen device. One or more pointing devices 1808 may be coupled to the one or more hardware processors 1804 for allowing input via the display device 1806.

[00215] The memory device 1802 may be any type of computer readable storage media as described herein.

[00216] Although FIG. 18 specifically refers to a GUI system, this is by way of example only. It is understood that methods and techniques described herein may also be carried out via other MUIs, including text based, virtual reality based, augmented reality based, mixed reality based, and others.

[00217] For instance, a hardware processor 1804 coupled to the memory device 1802 and the display device 1806 may display a current menu of choices on a first portion of a user interface display, allow a user to select a menu item from the current menu of choices displayed on the first portion of the user interface display and to drill down through levels of menu choices based on selecting a menu item from a prior level of menu choices. The hardware processor 1804 may also display on a second portion of the user interface display, past selected and past unselected menu items of the drilled-down levels, wherein the past unselected menu items are displayed as selectable options. The hardware processor 1804 may also allow the user to jump to a different path of menu choices by allowing the user to select a past unselected menu item from a previously navigated menu level displayed on the second portion of the user interface display.

[00218] The hardware processor 1804, for instance, may perform the method described with respect to FIGS. 1 and 3.

[00219] The GUI techniques described above may be implemented using computer languages such as JAVA, and JavaScript, but not limited to those languages. In an embodiment, the functionalities and modules of the system and methods of the present disclosure may be implemented or carried out in distributed manner on different processing systems or on any single platform, for instance, accessing data stored locally or in distributed manner on a computer network. Similarly, software protocols and managers of the present disclosure may be implemented or carried out in distributed manner on different processing systems or on any single platform, for instance, accessing data stored locally or in distributed manner on a computer network.

[00220] The GUI techniques may be carried out on any type of computing device, e.g., a desktop computer, laptop computer, mobile device (e.g., android or Apple IOS), tablet, and use any type of interface, e.g., mouse, touchscreen, etc. The GUI technique may also be carried out on an instrument, e.g., an assay instrument for performing biological assays such as immunological or nucleic acid assays. In some embodiments, the instrument performs electrochemiluminescence assays. In some embodiments, the instrument is an automated assays system, for example, comprising, (a) a single robotic controlled 8-channel pipettor, (b) a single robotic controlled assay plate gripper arm, (c) a single 96-channel channel assay plate washer, (d) a single plate reader, (e) one or more plate shakers with a total capacity of at least 5 plate shaking locations, and (f) a processor adapted to execute an assay process for analyzing a plurality of samples in 96-well

plates. Other computing devices, machines, systems and instruments include wearable devices, automotive computing systems, individual instruments including assay-related instruments such as plate washers, plate readers, plate shakers, incubators, work-flow aid instruments such as loading carts (e.g., as described in International Patent Appl. Pub. Nos. WO 2018/017156 and WO 2017/015636, which are incorporated by reference herein in their entirety), medical instruments and machines such as MRI and CT machines, ultrasound systems, consumer products such as home appliances, home systems including home management systems, air conditioning and heating systems, clothes washers and dryers, dish washers, ovens, slow cookers and other cooking devices.

[00221] Various embodiments may be program, software, or computer instructions embodied or stored in a computer or machine usable, readable or executable medium, which causes the computer or machine to perform the steps of the method when executed on the computer, processor, and/or machine. For instance, a program storage device readable by a machine, tangibly embodying a program of instructions executable by the machine to perform various functionalities and methods described in the present disclosure may be provided.

[00222] The system and method of the present disclosure may be implemented and run on a general-purpose computer or special-purpose computer system (or device). The computer system may be any type of known or will be known systems and may include a hardware processor, memory device, a storage device, input/output devices, internal buses, and/or a communications interface for communicating with other computer systems in conjunction with communication hardware and software, etc. The GUI techniques of the present disclosure may also be implemented on a mobile device or the like. Implementing the various computer instructions, software protocols, and modules as described herein on a general purpose computer may serve to transform a general purpose computer into a special-purpose computer system configured to carry out the specific methods, tasks, operations, and actions described herein.

[00223] FIG. 19 illustrates an example computer system 100 that may implement the system and/or method of the present disclosure. One or more central processing units (e.g., CPUs) 2 may include one or more arithmetic/logic unit (ALU), fast cache memory and registers and/or register file. Registers are small storage devices; register file may be a set of multiple registers. Caches are fast storage memory devices, for example, comprising static random access (SRAM) chips.

Caches serve as temporary staging area to hold data that the CPU 2 uses. Shown is a simplified hardware configuration. CPU 2 may include other combination circuits and storage devices.

[00224] One or more central processing units (CPUs) 2 execute instructions stored in memory 4, for example, transferred to registers in the CPU 2. Buses 6, for example, are electrical wires that carry bits of data between the components. Memory 4 may include an array of dynamic random access memory (DRAM) chips, and store program and data that CPU 2 uses in execution. The system components may also include input/output (I/O) controllers and adapters connected to the CPU 2 and memory 4 via a bus, e.g., I/O bus and connect to I/O devices. For example, display/graphic adapter connects 8 a monitor 28 or another display device/terminal; disk controller 10 connects hard disks 24, for example, for permanent storage; serial controller 12 such as universal serial bus (USB) controller may connect input devices such as keyboard 22 and mouse 20, output devices such as printers 26; network adapter 14 connects the system to another network, for example, to other machines. The system may also include expansion slots to accommodate other devices to connect to the system. For example, a hard disk 24 may store the program of instructions and data that implement the above described methods and systems, which may be loaded into the memory 4, then into the CPU's storage (e.g., caches and registers) for execution by the CPU (e.g., ALU and/or other combination circuit or logic). In another aspect, all or some of the program of instructions and data implementing the above described methods and systems may be accessed, and or executed over the network 18 at another computer system or device. FIG. 19 is only one example of a computer system. The computer system that may implement the methodologies or system of the present disclosure is not limited to the configuration shown in FIG. 19. Rather, another computer system may implement the methodologies of the present disclosure, for example, including but not limited to special processors such as field programmable gate array (FPGA) and accelerators.

[00225] In one embodiment, the present invention may be embodied as a computer program product that may include a computer readable storage medium (or media) and/or a computer readable storage device. Such computer readable storage medium or device may store computer readable program instructions for causing a processor to carry out one or more methodologies described here. In one embodiment, the computer readable storage medium or device includes a tangible device that can retain and store instructions for use by an instruction execution device. Examples of the computer readable storage medium or device may include, but is not limited to,

an electronic storage device, a magnetic storage device, an optical storage device, an electromagnetic storage device, a semiconductor storage device, or any suitable combination thereof, for example, such as a computer diskette, a hard disk, a random access memory (RAM), a read-only memory (ROM), an erasable programmable read-only memory (EPROM or Flash memory), a static random access memory (SRAM), a portable compact disc read-only memory (CD-ROM), a digital versatile disk (DVD), a memory stick, but not limited to only those examples. The computer readable medium can comprise both computer readable storage media (as described above) or computer readable transmission media, which can include, for example, coaxial cables, copper wire, and fiber optics. Computer readable transmission media may also take the form of acoustic or light waves, such as those generated during radio frequency, infrared, wireless, or other media including electric, magnetic, or electromagnetic waves.

[00226] The terms “computer system” as may be used in the present application may include a variety of combinations of fixed and/or portable computer hardware, software, peripherals, mobile, and storage devices. The computer system may include a plurality of individual components that are networked or otherwise linked to perform collaboratively or may include one or more stand-alone components. The hardware and software components of the computer system of the present application may include and may be included within fixed and portable devices such as desktop, laptop, and/or server. A module may be a component of a device, software, program, or system that implements some “functionality,” which can be embodied as software, hardware, firmware, electronic circuitry, or etc.

[00227] The storage device 1120, of which memory 4 and memory device 1802 represent examples, may be implemented as one or more computer readable storage media as described herein and may be employed to store various data and information with respect to the computer system 100.

[00228] In an embodiment, the storage device 1120 may store registration information such as a user identifier and a user account number. Registration information may be stored via data storage commands issued by the data storage manager 1064. In an embodiment, the registration information is stored in the storage device 1120. The registration information may be stored as one or more data structures. These data structures can include linked lists, b-trees, binary trees, heaps, stacks, queues, hash tables, red-black trees, binomial heaps, Fibonacci heaps, etc. In one example, the registration information may be stored in a registration table. The registration

information includes at least a user identifier associated with the user and an account number. Since multiple users may be assigned to the same account number, the system may track this using a shared account flag, such as a semaphore, bit, or the like. When multiple users are assigned to the same account number the shared account flag may be set to a first specific value. Otherwise, the shared account flag may be set to a different specific value. Using a shared account flag is one way of tracking a shared account and this disclosure is not limited to this example. Other methods may be used. The shared account flag may be a column of the registration table. For each user identifier having the same account number, the shared account flag is set to the specific value and associated with the user identifier.

[00229] In other aspects, multiple account numbers may be linked together. In embodiments, the user manager 1056 may issue commands for managing user account numbers. In an embodiment in accordance therewith, the multiple account numbers may represent a team such as a research, project, corporate, university, or experiment team. The system may track the multiple account numbers and team using a multiple account flag. When different account numbers are linked, the multiple account flag may be set to a first specific value otherwise, the multiple account flag may be set to a different specific value. Using a multiple account flag is one way of tracking the linking of the different account numbers and this disclosure is not limited to this example. Other methods may be used. In one embodiment, the multiple account flag may be a column of the registration table. For each linked account number, the multiple account flag is set to the specific value and associated with the account numbers.

[00230] In other embodiments, the storage device 1120 may also store login historical data. The login historical data may be received via the input manager 1052, organized via the user manager 1056, and stored via the data storage manager 1064. The login historical data may include the user identifier/account number and time/date information for each time a user (or different users) logs into the system. The login historical data may be maintained in the storage device 1120 for a predetermined or indeterminate period of time. The predetermined period of time may be based on a specific application being executed or to be executed.

[00231] In other embodiments, the storage device 1120 may also store user selection history. The user selection history may be received via input manager 1052, organized via user manager 1056, and stored via data storage manager 1064. The user selection history may include a selected menu item, the user identifier/user account associated with the selection and time/date of selection.

The user selection history may also be stored in the storage device 1120 for a predetermined or indeterminate period of time. The predetermined period of time may be selected according to the MUI module from which the user selection was initially made. The predetermined period of time for stored user selection history and the login historical data may be the same.

[00232] In other embodiments, the storage device 1120 may include exclusion information. The exclusion information may include menu items and/or choices that are to be excluded from display in hierarchical menu levels on the MUI for one or more users, devices or interfaces. The exclusion information may be managed by commands issued via the exclusion manager 1058 and stored by commands issued via the data storage manager 1064.

[00233] The commands that are issued or provided by the menu manager 1054 of the methodical user interface control system 1102 allow for a user to move bi-directionally between hierarchical menu levels (backward and forward), backward being to a higher hierarchical menu level and forward being to a lower hierarchical menu level including being able to view past or prior menu items that have been selected or not selected. For example, various menu levels and/or choices from one or more levels of a given path of hierarchical menus, can be viewed concurrently on the MUI.

[00234] In an embodiment, a display command may be provided by the display manager 1050 for a specific set of hierarchical menu level(s) to be displayed on a specific portion of the MUI. The display command is configured to cause display of one or more menus in one or more portions of the MUI. The specific hierarchical menu level may include one or more menu items (or choices). The display command may include the one or more menu items, a specific display order, a display orientation, display size (and format) and manner in which the choices are displayed, such as scrolling method, although other manners in which to arrange and/or display the choices are contemplated as well. In an embodiment, the scrolling method may define the display orientation and thus, the display command does not necessarily include a separate display orientation and scrolling method.

[00235] In an embodiment, each menu item in a specific hierarchical menu level may be displayed in the same size. In other embodiments, one or more specific menu items may be displayed larger or smaller than other menu items.

[00236] The display command may specify the scrolling method. For example, the display command may specify that the menu items are to be displayed in a graphical wheel that rotates the

items in a direction, for example, horizontal or vertical (e.g., left and right or up and down) or another direction. In another embodiment, the display command may specify that the menu items are to be displayed as a graphical slider that slides the items in a direction, for example, horizontal or vertical (e.g., left and right, up and down) or another direction.

[00237] Different display commands may specify different scrolling methods or orientations, or different commands can employ the same or similar scrolling methods or orientations. In an embodiment, the orientations in the different commands (such as the first command and the second command) may specify that the orientations are substantially orthogonal to each other. In other embodiments, orientations can be horizontal, substantially horizontal, vertical, substantially vertical, concentric, and substantially concentric vis-à-vis one another. As used herein, substantially may be + or - 5°. In other aspects, substantially may be + or - 10°. In other aspect, substantially may be + or - 15°. In other aspects, substantially may be determined by percentage, such as 80% or 90%.

[00238] FIGS. 2A – 2O show examples of user interface displays in different embodiments, details of which are further described below.

[00239] FIG. 3 is a flow diagram illustrating a method of interactively displaying interactive items on a user interface display for computer-user interaction in another aspect, for example, details of the method wherein a vertical and horizontal switching of menu levels may take place. The method may be performed automatically by at least one hardware processor. At operation 302, a list of menu items may be displayed on a first portion of the user interface display. The list of menu items is displayed in a first visual orientation on the first portion. For instance, the first visual orientation may be a vertical orientation. The list of menu items may include one or more menu items from a first menu and may be displayed in response to a first display command provided by the display manager 1050.

[00240] FIG. 2A shows an example of a user interface display in one embodiment. As shown, the menu items 202 are displayed in one orientation, for example, vertically, in a first portion 204 of the display 206. The menu items are interactive, for example, in that the items are selectable, and a selection (e.g., a user selecting a menu item by clicking on a user interface menu item) causes a computer to execute programmed functions.

[00241] As illustrated in FIG. 2A, the menu items 202 of a first menu are provided in a first portion 204 of the interface in a wheel oriented vertically, i.e., a first orientation. The MUI includes

a display 206. The first portion 204 may display the menu items 202 in response to a first display command for a first menu of user-selectable choices to be displayed on the first portion 204 of the MUI. As discussed above, the first display command may be provided by the display manager 1050.

[00242] The first display command includes the menu items for the first menu (which, in one embodiment, are stored in the storage device 1120, the scrolling method/orientation and size (and format). For example, the orientation for the menu items for the first menu (to be displayed in the first portion) may be vertical. The first display command may also include a location of display, e.g., location of the first portion. The first portion may be in a central location on the MUI. Each menu item may be selectable by the user.

[00243] In an embodiment, the first portion may include a decision-making zone. The decision-making zone may be located at a central location within the first portion. The decision-making zone may be a location in the first or active portion wherein a prominent or highlighted menu item is displayed for immediate selection. For example, in FIG. 2A, MENU ITEM 4 is shown in a decision-making zone and is shown in a larger size font than the remaining menu items so as to be a prominent or highlighted menu item displayed for immediate selection. The first display command for causing provision of the first menu may specify that menu items displayed within the decision-making zone be emphasized or highlighted, such as being displayed in a larger size font than other menu items not in the decision-making zone. In other aspects, the menu item(s) displayed within the decision-making zone may be bolded, italicized, or highlighted using a different color than the background, or underlined.

[00244] In other embodiments, the first display command may specify that menu items displayed outside the decision-making zone be deemphasized, such as making the menu items smaller, faded with respect to the other menu items in the decision-making zone.

[00245] The first display command is executed by the hardware processor and causes the first menu to be displayed on the first portion of the MUI. The MUI allows the user to select one or more menu items from the displayed menu items on the first portion 204 and to drill down through hierarchical menu level(s) of menu items based on selecting a menu item from a prior and/or subsequent hierarchical menu level(s) of menu items. When a menu item(s) is selected from the first menu displayed on the first portion 204 of the MUI, the input manager 1052 receives and interprets the selection.

[00246] As shown in FIG. 2A, all first menu items 202 displayed in the first portion 204 are selectable. MENU ITEM 4 is shown as a prominent menu item and is highlighted as being immediately selectable. As used herein, “immediately selectable” means that a single action, such as clicking by a user, causes the selection of the menu item. MENU ITEM 4 is selectable and highlighted as a prominent menu while the other MENU ITEMS (1, 2, 3, 5, and N) are unhighlighted as receded menu items. The receded menu items are non-immediately selectable, meaning that they require more than one user action for selection. Clicking on the highlighted immediately selectable menu item by the user causes it to be selected. The other menu items may be highlighted for immediate selection through rotation of the wheel or clicking on them. Receipt of a signal, by the input manager 1052, indicative of clicking on the immediately selectable menu item causes the input manager 1052 executing on the processor 1110 to detect the selection of the prominent immediately selectable menu item. Responsive to the selection, the input manager 1052 issues a command to the menu manager 1054 indicative of the selection. The menu manager 1054 then determines the new menu arrangement to be displayed according to the selection and provides a relocation command to the display manager 1050 to cause a change in the MUI.

[00247] Referring back to FIG. 3, at operation 304, responsive to detecting a selection of a menu item from the list of menu items, the list of menu items is relocated to a second portion of the user interface display. The list of menu items is displayed in a second visual orientation on the second portion, the second visual orientation being substantially orthogonal (e.g., perpendicular) to the first visual orientation. For instance, the second visual orientation may be a horizontal orientation.

[00248] A relocation command causes the first menu of menu choices 202 to be relocated from the first portion 204 to the second portion 208 of the MUI display 206. FIG. 2B illustrates the results of the relocation command. The relocation command may include the menu choices of the first menu to be displayed in the second portion 208, the size and orientation of display, the necessary visual components for display, an indication as to which menu item was selected to cause relocation, and any other information discussed herein with respect to the display command. The relocated first menu, displayed now in the historical or second portion 208 as a past menu, may include one or more or all of the menu items 202 and choices previously made available to the user. The menu item 202 selected by the user to cause the relocation becomes a past-selected menu item while the unselected menu items from menu items 202 become past-unselected menu items. The past-unselected menu items are representative of previously navigated hierarchical

menu levels. After relocation of the menu items 202 of the first menu, the display manager 1050 causes the MUI to display, in the active or first portion 204, submenu items 210 of the second menu responsive to the first menu selection as a new current or subsequent level of menu choices for the user to interact with. As illustrated in FIG. 2B, the subsequent or second level of menu choices includes second submenu items 210 displayed in the active or first portion 204 of the MUI display 206.

[00249] In a method in accordance with an embodiment, upon receiving a signal from the input manager 1052 indicating that a menu item 202 has been selected from the first portion 204, the relocation command is issued. For example, the menu manager 1054 provides the relocation command to the display manager 1050. The relocation command instructs the display manager 1050 to move the first menu from the first portion 204 of the MUI display 206 to the second portion 208 of the MUI display 206 in a second menu. The second portion 208 is at a different location on the MUI display 206 than the first portion 204. Since a menu item was selected from the first menu of menu items 202, the relocated first menu of menu items 202, as displayed in the second portion 208, will now have both a past-selected menu item(s) and past-unselected menu item(s) (e.g., one or more menu items that the user could have selected, but did not). The relocation command may include the first menu items, scroll method and/or orientation, display size (and format) and the location of the second portion.

[00250] In an embodiment, the second portion 208 is located farther from a central location of the MUI display 206 than the first portion 204.

[00251] In an embodiment, the orientation of displaying the menu items 202 in the first menu in the second portion 208 is different from the orientation of the display of the submenu items 210 in the second menu in the first portion 204. For example, orientation of the menu items 202 in the second portion 208 may be substantially orthogonal to the orientation of the submenu items 210 in the first portion 204. The relocation command may specify that the orientation of the menu items 202 is horizontal (whereas the first display command specified that the orientation of the menu items 202 was vertical). In other embodiments, the orientation may be reversed, where menu items 210 in the first portion 204 are horizontal and the menu items 202 in the second portion 208 are vertical. In embodiments, the first portion 204 is located in a central lower portion of the MUI display 206 and the second portion 208 is located in an upper portion of the MUI display 206.

[00252] The relocation command may also specify different sizes for menu items. For example, the selected menu item(s) from the first menu (which triggered the relocation) may be specified to be displayed in an emphasized manner, such as being displayed in a larger font size than unselected menu items. In other aspects, the selected menu item(s) may be bolded, italicized, or highlighted using a different color than the background, or underlined. In another aspect, the relocation command may also specify a relative position of the menu items 202 within the second portion 208. For example, a selected menu item(s) may be positioned in a central location within the second portion relative to other menu items (non-selected menu items).

[00253] In other aspects, non-selected menu items from the hierarchical menu level may be displayed in a deemphasized manner. For example, the relocation command may specify the non-selected menu items to be a smaller font size or faded relative to the selected menu items. In other aspects, the relocation command may specify the non-selected menu items to be displayed further from the central portion of the second portion than a selected menu item(s) for the same hierarchical menu level.

[00254] The first portion and the second portion may be displayed on the user interface display such that they are non-overlapping. The menu items relocated to the second portion are selectable from that position or location, and the selected menu item may be graphically highlighted, for instance, to provide a visual indication of which item from the list has been selected. The selected menu item may also be centered with other menu items to the left and/or right of the selected menu item. The submenu items that are displayed where the relocated menu items were displayed (before the relocation) are also selectable items. FIG. 2B shows an example of the user interface display in one embodiment with a relocated list of menu items. As shown, the menu items 202 are relocated to a second portion 208 of the display 206, for instance, above the first portion 204, and displayed horizontally. As described in more detail below, the second portion of the display may include many levels of menu items, for example, levels of past decisions and also the options in those levels that were not chosen. Thus, the number of levels of past decisions may be, e.g., 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, or more, e.g., 1-2, 1-3, 1-4, 1-5, 1-6, 1-7, 1-8, 1-9, 1-10, 1-11, 1-12, 1-13, 1-14, 1-15, 1-16, 1-17, 1-18, 1-19, 1-20, and nested ranges therein, e.g., 2-20, 2-19, 2-18, 3-20, 3-19, 3-18, etc. The second portion, for instance, visualizes a representation of a path of past decisions taken and other decisions (other paths) not taken. In an

embodiment, the past decisions taken (menu item chosen) may be aligned, e.g., vertically, e.g., in the center.

[00255] The second portion 208 may be caused to display the first menu items 202 in response to a relocation command for a first menu of user-selectable choices to be displayed on the second portion 208 of the MUI display 206. As discussed above, the relocation command may be provided by the menu manager 1054 to the display manager 1050. The first menu of user-selectable choices may include both past-selected and past-unselected menu items. The first menu can include one or more of the first menu items 202 that are selectable by the user. The menu items 202 may be immediately selectable or non-immediately selectable.

[00256] The second portion 208 may also include one or more decision-making zones. The relocation command may also specify that menu items displayed within the decision-making zone be emphasized or highlighted. In other aspects, the menu item(s) displayed within the decision-making zone may be bolded, italicized, or highlighted using a different color than the background, or underlined. In other embodiments, the relocation command may specify the same. In other embodiments, the relocation command may specify that menu items displayed outside the decision-making zone be deemphasized or dehighlighted.

[00257] The first portion 204 and the second portion 208 are displayed on the MUI display 206 so that they are both viewable, for example, viewable concurrently. The MUI display 206 may be presented via one or more physical display screens. The second portion 208 may contain one or more menus, each menu including both past-selected and past-unselected menu items from previously navigated hierarchical menus. In the representation shown in FIG. 2C, the second portion 208 (historical portion) includes menu items 202 and submenu items 210, each of which were included in the first portion 204 in a previous MUI representation. The menu items 202 and sub-menu items 210 which were past-selected, i.e., those menu items that led to the sub-submenu items 212 being displayed in the first portion, may be highlighted or emphasized to indicate that they were previously selected. As shown in FIG. 2C, MENU ITEM 4 and SUBMENU ITEM 3 are highlighted to indicate that they were previously selected.

[00258] The past-unselected menu and submenu items are displayed as selectable options. The past-selected menu item (or choice) also may be displayed as a selectable option, where both are displayed on the second portion 208 (e.g., a historical portion, which can include one or more menu items previously made available to a user). The historical portion contrasts with an active

portion, which can include current, user-selectable choices (e.g., located on the first portion of the display) for the current hierarchal menu level. The historical portion can allow users to make selections as well, e.g., by making a selection among previously selected hierarchal levels and/or menus. In this manner, the historical second portion 208 may represent a “trail of breadcrumbs” showing to a user the ordered path of selections made to arrive at the current menu as displayed in the active first portion 204. Further details on selections made in the second portion 208 are provided below.

[00259] In some embodiments, the first portion 204 may be adapted to take up a larger portion of the display area of the MUI than the second portion 208. The second portion 208 may be displayed across a smaller area than the first portion 204. The first portion 204 and second portion 208 may be adapted for display in a manner that provides contrast against a background on which they are displayed. For example, the first portion 204 and second portion 208 may be displayed in bright pixels against a dark background or dark pixels against a bright background.

[00260] In other embodiments, a command (such as, for example, a relocation command) may be provided by the menu manager 1054 to move or relocate a menu from a portion of the MUI display 206 to another portion of the MUI display 206. In one embodiment, the moving or relocating of a menu and/or menu item(s) can include providing a command to move a menu from one portion of the display to another. In another embodiment, the moving or relocating of a menu can include issuing multiple commands, for example, one command to remove the menu from the first portion 204 of the display and another command to display the menu (either in the same format and/or orientation or in a different format and/or orientation) on a second portion 208 of the display. This relocation can occur, for example, in response to a user’s selection from a menu (e.g., a first menu).

[00261] Referring back to FIG. 3, at operation 306, on the first portion of the user interface display, where the list of menu items was previously displayed before being relocated to the second portion, a first list of submenu items associated with the selected menu item is displayed in the first visual orientation. Shown in FIG. 2B, a first list of submenu items 210 is displayed in the first portion 204, for instance, vertically.

[00262] Referring back to FIG. 3, at operation 308, responsive to detecting a selection of a submenu item from the first list of submenu items, the first list of submenu items is relocated to the second portion, wherein the first list of submenu items is displayed in the second visual

orientation and stacked with the list of menu items displayed on the second portion. At operation 310, on the first portion of the user interface display, a second list of submenu items associated with the selected submenu item is displayed in the first visual orientation, for example, vertically. FIG. 2C shows an example of the user interface display in one embodiment with a second list of submenu items. As shown, the first list of submenu items 210 is relocated to the second portion 208, stacked for instance below the relocated list of menu items 202, for example, stacked horizontally. The second list of submenu items 212, i.e., sub-submenu items associated with the selected submenu item, is displayed in the first portion 204. Depending on the depth of the menus or submenus navigated, the horizontal menu structure in the second portion 208 may accumulate a number of menu levels that exceed the number that can be displayed together on the display portion at the second portion 208 (e.g., the number of levels stacked exceed the screen portion allocated for the horizontal menu structure of the second portion 208). In one embodiment, the horizontal menu structure of the second portion 208 may show n number of menu levels, e.g., the last 3 submenus, allowing for scroll capability. For example, scrolling up allows the user to see the other menu items. The number n may be any number, not limited to 3, e.g., 2, 3, 4, 5, etc. In another embodiment, the top m (e.g., 2) menus may be displayed along with the bottom 1 submenu to provide top-level context to the last decision. The number m may be any number, not limited to 3, e.g., 2, 3, 4, 5, etc. Scroll capability allows for displaying other menu items, e.g., user can scroll to see other menu items. The user may also expand the entire multi-level of menus and submenus.

[00263] As shown in FIG. 2C, a subsequent level of menu choices, e.g., sub-submenu items 212, may be at least one hierarchical menu level (from a third menu) or more than one hierarchical menu level below (from a fourth, fifth, sixth, etc., menu) the first menu of menu items 202. In the example of FIG. 2C, sub-submenu items 212 represent a third menu that is two hierarchical levels below the first menu of menu items 202.

[00264] The process of relocating, for example, menu items from one portion to another portion of the user interface display as menu items are selected may continue up or down the levels of the menu items. For instance, the processing at operations 308 and 310 in FIG. 3 may repeat for additional levels of submenus. In another aspect, selecting menu items from the relocated list of menu items may function as a “back” button, without a user having to explicitly click on a back button to return to the previous list of menu items. Yet in another aspect, if a number of relocated

lists of menu/submenu items that are stacked reach a predefined number or threshold, for example, such that stacked list in that the area of the second portion becomes too large and encroaches into the area of the first portion, the stacks themselves may be displayed as a rotating wheel or slider, for instance, in the first visual orientation. Thus, for example, menu items in each of the stacked list may be displayed in the second visual orientation (items are slidable in that direction, e.g., horizontally), while each list in the stacked lists is slidable in the direction of the first visual orientation (e.g., vertically). In this way, a vertical bread crumb may be provided on the horizontal sliders and contextualized by the other options to the left and/or right of center (a selected item). Any layer may be adjusted in real time while not having to go back. Such displaying of the vertical and horizontal sliders allows for proceeding through a tree of options and picking desired leaf options. In another aspect, the number of menu and/or submenu items can be collapsible and expandable. For instance, the bottom or last 'n' levels (e.g., 3 levels) which are the most recent may be displayed with the rest of the levels collapsed. Those collapsed levels are made expandable, for example, by user input. As another example, the top 'm' levels (e.g., 2 levels) and the bottom level (e.g., '1' level) may be displayed, representing the top-level context with the most recent option or decision the user is working on (i.e., bottom level).

[00265] While FIGS. 2A-2C show the first visual orientation as vertical and the second visual orientation as horizontal, the orientations may be switched. For instance, the first visual orientation may be horizontal and the second visual orientation may be vertical. In another aspect, the first visual orientation and the second visual orientation may be of any other positional display orientations.

[00266] As described above, the menu items and associated submenu items may be displayed as a slider graphical element, a rotating wheel graphical element, or another graphical user interface element. For example, concentric wheel elements, as described below with respect to FIGS. 2H-2J may be employed.

[00267] In embodiments, an ordering or arrangement of menu items within their menu levels may be determined according to attributes of the menu items. The manner in which the menu items are displayed may be based on attributes selected from whether a menu item is a previously selected or previously unselected item, whether a menu item is selectable or unselectable, whether a menu item includes one or more characters typed by a user, whether a menu item is part of an

advanced context menu (described in greater detail below), and/or whether a menu item has a position in a list more central relative to other items in the list.

[00268] In embodiments, the way menu items are adapted to be displayed, i.e., the ordering, arrangement, coloring, and presentation of menu items, may be determined according to several different factors. For example, the menu manager 1054 and display manager 1050, in conjunction, may be configured to emphasize menu items that are selected or are past selected, are currently available to the user (i.e., selectable), and/or are positioned in a decision making zone of a first portion 204 or a second portion 208. The menu manager 1054 and display manager 1050 may further be configured to deemphasize menu items that are not selected or are past-unselected, that are currently unavailable to the user, and/or that are positioned away from the decision making zone. In some embodiments, immediately selectable menu items may be emphasized while non-immediately selectable items may be deemphasized. In some embodiments, emphasizing or deemphasizing a menu item may include highlighting or dehighlighting the menu item, as discussed herein. Highlighting or emphasizing may include, for example, bolding, increasing in font size, changing fonts, underlining, changing brightness or contrast, or adjusting position on the display relative to other items. Dehighlighting or deemphasizing may include decreasing in font size, changing fonts, fading, changing brightness or contrast, or adjusting position on the display relative to other items.

[00269] The MUI allows the user to jump to a different path of menu items (e.g., by selecting one or more additional menu items at the same, higher, or lower hierarchical level of a menu) by allowing the user to select a past-unselected menu item from a previously navigated menu level displayed on the second portion 208 of the MUI display 206 and a newly displayed menu item(s) on the first menu displayed a current menu being displayed on the first portion. As discussed above and with respect to FIG. 2C, previously navigated menu items (including submenu items, sub-submenu items, etc.) may be relocated to the second portion 208 after a menu item is selected.

[00270] The previously selected menu items in the second portion 208 may be highlighted or emphasized to visually indicate the menuing path that has been taken to arrive at the menu or submenu currently displayed in the first portion 204. Previously unselected menu items from the second portion may be selected to permit the user to jump to that branch of a menu. In the example of FIG. 2C, a user has previously selected MENU ITEM 4 and SUBMENU ITEM 3. Selection of a new and previously unselected submenu item 210 from the second portion 208 would cause the

menu manager 1054 to issue commands for a new list of sub-submenu items 212 associated with the newly selected submenu item 210 to be displayed as the current menu being displayed in the first portion 204. Selection of a new and previously unselected menu item from the menu items 202 would cause the menu manager 1054 to issue commands to cause the display of a new list of submenu items associated with the newly selected menu item 202 as the current menu being displayed in the first portion 204. In this way, a user may actively jump between various portions of a menuing tree without having to navigate back through the previous decisions.

[00271] When a previously unselected menu item (or submenu item, or sub-submenu item, etc.) is selected, a save command may be issued to store a state of the current menu in the first portion before the subsequent menu in the first portion is displayed. In embodiments, as disclosed in greater detail below, navigating through the menu items to a final branch in the menuing tree at the level of an executable menu allows a user to make one or more parameter selections. Should a user navigate away from an execution level menu, the parameters that were currently selected at the time the user navigated away may be stored via a save command issued by the menu manager 1054 to the data storage manager 1064. Accordingly, if a user should later wish to return to the execution level menu, the last selected parameters will be displayed.

[00272] Previously unselected menu items may be selectable within the past menu of previously navigated menu items. In embodiments, previously unselected menu items may be immediately selectable, requiring only a click for selection, or may be non-immediately selectable, requiring another step to highlight the menu item prior to selection. In embodiments, the previously selected menu items may be unselectable, as the user has already selected them. In further embodiments, only the previously selected menu item from the lowest hierarchical level in the past menu (i.e., the menu immediately previous to the current first menu) is unselectable, while the previously selected menu items from higher hierarchical levels remain selectable. In the example provided by FIG. 2C, SUBMENU ITEM 3 may be unselectable while MENU ITEM 4 may be selectable.

[00273] In embodiments, the various menus are displayed on a background. In an embodiment, the menus are superimposed over the background. The background may consist of one or more colors. In an embodiment, at least a preset percentage of the background pixels may be monochromatic. For example, at least a preset percentage of the background pixels may be black. For instance, 75% of the background may be monochromatic (e.g., black, white, gray, etc.). The specific percentage has been described by way of example and other percentages may be used.

[00274] In embodiments, display commands and relocation commands may specify the background, including the preset percentage and color, e.g., black, white, gray, etc. In certain embodiments, the background may also include areas of the menus other than text (e.g., menu items). In an embodiment, the text of the menus is displayed in a color to contrast or emphasize the text with the background. For example, when a black background is used, white or yellow may be used for the color of the text, although other colors may be used as well. In other embodiments, the backgrounds and/or text may be comprised of more than one color.

[00275] In some embodiments, an initial or first menu, i.e., the starting current menu, may be a default menu that is displayed upon a login of a registered user. In an embodiment, a default menu may be customized for a specific user identifier. In other aspects, the default menu may be specific to a MUI module. For example, the default menu may include as menu items a list of assays, tests, runs, clinical trials, etc. In embodiments in accordance herewith, the default menu is determined according to one or more of the following: a MUI module being run, a location of a device running the MUI module, a user identifier, and an application of the menu. For example, a device located at a user's desktop may run a MUI module that defaults to a default menu suitable for selecting options for experimental design or experimental analysis. In another example, a device located at a clinical instrument may run a MUI module to provide a default menu suitable for selecting options to run an experiment and collect data. In embodiments, the default menu may be a first menu, second menu, third menu, and/or any other menu from a level in a hierarchical menu tree.

[00276] In an embodiment, any menu provided in any portion of the MUI display may include search functions. The search function enables a user to enter keywords or other inputs associated with menu items (options). A user input is received via the input manager 1052 and transferred to the menu manager 1054 for searching purposes. The searching allows for the functions (menu items) to be filtered using the entered keywords or other inputs, which shortens a time needed to find a desired menu item. An interface for the search function may be positioned in a central location of respective portions of the MUI display 206, or in the alternative, other portions of the MUI display 206. In further embodiments, no visual interface is provided for the search function. In such an embodiment, a user may access the search function merely by typing.

[00277] In an embodiment, any menu item(s) that match or partially match the keyword(s) may be displayed to emphasize the menu item(s). For example, the menu item(s) may be displayed in a larger size than other menu items that do not match or partially match. In other embodiments,

the menu item(s) may be bolded, italicized, or highlighted using a different color than the background, or underlined. In other embodiments, menu item(s) not matching or partially matching the keyword(s) may be deemphasized, such as the menu item(s) being smaller or fading the text with respect to the text of menu item(s) that match or partial match. In embodiments hereof, sliders or wheels may be automatically advanced and/or rotated to display menu items matching search terms.

[00278] In an embodiment, a first menu selection may operate as a filter on a second menu. In a hierarchical tree, each of several items in a first menu may lead to the same second menu. However, the first menu selection that is made determines the menu items shown when the second menu is displayed. In a simple example, the first menu may include menu items pertaining to team roles while a second menu may include a menu pertaining to team responsibilities. The selection of a specific team role at the first menu may filter the second menu to only show team responsibilities that correspond to the selected role. In some embodiments, such filtering is performed by making specific items of the second menu unselectable.

[00279] In an embodiment, any selection made in any menu operates as a filter on the menu items displayed in any other menu. For example, in an embodiment, a series of items in the first menu may be a series of category filters that each lead to a second menu. Each second menu leads to a series of submenus and, eventually, one or more execution menus, permitting the user to select parameters for the selected category filter. After selecting category filters in one or more of the category filter submenus, a user may then select another first menu item that provides a list of second menu items filtered according to the category filters that have previously been selected.

[00280] In an embodiment, one or more menus or menu levels may be presented as exceptions to the hierarchical menu tree standard discussed herein. For example, a menu level may include a visual display and/or a video display rather than a text based visual component. Exceptions may be implemented, for example, in situations where information may better be conveyed through alternate means. For example, as discussed above, an execution level menu may include a walkthrough, which may be best presented via a video or series of images. In another example, an execution level menu may be presented for data analysis, and may provide any combination of graphs, charts, tables, etc. to assist in data analysis.

[00281] In an embodiment, an advanced context menu may be provided via one or more commands issued by the menu manager 1054. FIG. 2P illustrates an example of a methodical user

interface including an advanced context menu 270. The advanced context menu 270 contrasts with the first portion and the second portion, which together provide a “direct workflow mode.” The advanced context menu 270 may be accessed via an advanced context menu selector 290, which may, in embodiments, be present on some or all screens of a methodical user interface. The advanced context menu 270 provides additional advanced menu items 271 beyond the items appearing in the current menu in the active first portion 204 or one or more past menus appearing in the historical second portion 208. The advanced context menu 270 may be accessed by clicking or hovering over the advanced context menu selector 290 or otherwise indicating a desire to access the advanced context menu 270. The advanced context menu 270 includes a selection of advanced menu items 271.

[00282] The selection of advanced menu items 271 may include items displayed in the current menu in the first (active) portion 204 and items displayed in the previous menus in the second (historical) portion 208. In accordance with an embodiment hereof, advanced menu item(s) 271 of the advanced context menu 270 may be emphasized. For example, the advanced menu item(s) 271 may be displayed in a larger font size. In other embodiments, the menu item(s) may be bolded, italicized, or highlighted using a different color than the background, or underlined.

[00283] Other items included in the selection of items in the advanced context menu 270 may be items related to but not currently included in one of the displayed menus. That is, the selection of items in the advanced context menu 270 is driven by the current context of the UI display. For example, five menu items of a first menu may be displayed as the current menu in the active portion. Three additional menu items related to the five menu items of the first menu may be displayed in the advanced context menu 270. The three additional menu items may be items of the first menu that were excluded or limited (as discussed further below) from the current menu display for various reasons.

[00284] The advanced context menu 270 offers the user a greater array of accessible menu items without causing clutter in the active portion or the historical portion. In embodiments, some of the advanced menu items 271 in the advanced context menu 270 may be items that are infrequently selected, for example, in less than 50, 45, 40, 35, 30, 25, 20, 15, 10, or 5 % of use cases. Advanced menu items 271 of the advanced context menu 270 may be selected according to patterns of user interaction with the MUI, as explained in greater detail below.

[00285] In embodiments, the advanced context menu 270 may include three portions. A first top portion 272 of the advanced context menu 270 may include advanced menu items 271 related to the currently active menu, as described above. A second, middle portion 273 of the advanced context menu 270 may include advanced menu items 271 pertaining to MUI modules available on the same workstation at which the advanced context menu 270 is selected. These options may permit a user to swap modules based on a desired task. A third, bottom portion 274 of the advanced context 270 menu may include global functions, such as login/logout functionality, user manuals and help, EULA information, and privacy policy information. The above described ordering is not limiting, and any of the described advanced menu items 271 may be presented in a different order.

[00286] In embodiments, when the advanced context menu 270 is selected, the MUI causes other graphics, text, etc. to become faded and/or blurred. The advanced context menu 270 is displayed on a transparent background so that the advanced context menu 270 and the rest of the background are the same (e.g., black). Accordingly, the MUI provides a dialog box adapted to be displayed on the foreground of the UI display to prompt a user for additional information or notify the user of an error, wherein the background of the dialog box is further adapted to match the background of the first and second portions of the UI display, further wherein one or more of text, graphics, photos, and videos displayed in the background of the first and second portions of the UI display are adapted to be displayed out of focus when the dialog box is being displayed on the foreground of the UI display.

[00287] In an embodiment, certain menu items included in a hierarchical menu tree, i.e., a first menu, second menu, third menu, etc., may be excluded or restricted from being displayed when that menu is being displayed. Exclusions and restrictions may be managed by the exclusion manager 1058 in conjunction with the menu manager 1054. Displaying any menu from a menu tree includes displaying one or more menu items from that menu but does not necessarily require display of all items from that menu. Menu items of a hierarchical menu level(s) may be excluded or restricted from being displayed based on an exclusion table. Exclusion tables may correspond to a user identifier, email address, username, team, and/or account number. In other embodiments, one or more entire menus from a menu tree may also be excluded based on an exclusion table. In certain embodiments, exclusion or restriction information may be stored in the storage device

1120. The exclusion or restriction information may be stored as a data structure. Any data structure described herein may be employed.

[00288] Exclusion or restriction information may be used to exclude menu items from the view of a particular user, group of users, type of user, etc. For example, administrative menu items or menu levels may be excluded from view of a user or operator that is an engineer or technician. In another example, design menu items or menu levels may be excluded from view of a user or operator that is a lab assistant or lab technician.

[00289] User identifiers, account numbers and the menu item(s) and/or menus for exclusion may be input by an administrator. For example, an admin console module, discussed in greater detail below, may be used to manage and generate exclusion tables. The managing may be done when a user registers with the system. In other embodiments, the exclusion information may be added after registration and periodically updated.

[00290] In embodiments, each time a user logs into the system, the hardware processor maintains a record of the login (and also a log out) via the data storage manager 1064. In an embodiment, this record, i.e., login historical data, may be in a form of any data structures described herein. In an embodiment, this login historical data may include the user identifier and/or account number, a login time/date and a log out time/date. In an embodiment, upon receipt of the login information, the data storage manager 1064 adds the user identifier and/or account number and the login time/date to the login historical data.

[00291] In certain embodiments, before issuing a command for displaying any menu, the menu manager 1054 may check the exclusion table (for example, stored in the storage device 1120) to determine if any menu items in the initial display menu (e.g., default menu) are listed to be excluded from display for the user (or account number). In an embodiment, the menu manager 1054 may match the user identifier and/or account number of the user currently logged in with user identifiers and/or account numbers listed in the exclusion table. If there is a match, then the menu items listed in the exclusion table are to be excluded from being displayed in the initial display menu. This exclusion may be carried out, through the issuance of a separate exclusion command and/or instruction, or in the alternative, the exclusion can occur by modifying any display commands that cause the available menu item(s) to be displayed. The menu manager 1054 may remove the menu items included in the list from the menu items in the initial display menu (e.g., default menu) and issue the first command without the removed menu items.

[00292] In certain embodiments, each time the input manager 1052 receives a selection of a menu item in the current menu, prior to issuing a relocation command, the menu manager 1054 may determine whether any menu item on a hierarchical menu level lower than the hierarchical menu level currently being displayed on by the MUI display 206, as the current menu, is listed to be excluded (or whether a lower hierarchical menu is to be excluded). The determination may use the login historical data and the exclusion table. The login historical data may be used to confirm that the same user (user identifier or account number) is still logged in and match the same with user identifiers and account numbers in the exclusion table. In other embodiments, the menu manager 1054 may use a user identifier and account number received from the user manager 1056 instead of the login historical data for the determination. In other embodiments, a similar determination is made prior to issuing any relocation or display command.

[00293] In yet other embodiments, different exclusion tables may be used depending on whether the menu items are to be displayed on the MUI display 206 in the first portion 204 or the second portion 208. In accordance with this embodiment, the exclusion table may have additional columns of information, one column for each portion (menu). A column for the first portion lists menu items to be excluded when displayed on the first portion 204 of the MUI display 206, a column for the second portion 208 lists menu items to be excluded when displayed on the second portion of the MUI display 206, and columns for additional portions list additional menu items to be excluded when displayed on any additional portions of the MUI display 206.

[00294] As described above, an account number may be associated with multiple users (user identifiers). Thus, when an account number is used as the basis of exclusion, all of the users associated with the account number may have the menu items excluded from being displayed on the MUI display 206.

[00295] In another embodiment, since certain account numbers may be linked, when the account number is used, any account number linked with the account number may also have menu items excluded.

[00296] In other embodiments, instead of excluding menu items, the menu items may be moved to a position of the respective menus to deemphasize the menu items with respect to other menu items. In accordance with this embodiment, the exclusion table may be used by the menu manager 1054 to reorder or change positions of the menu items on a hierarchical menu level. A subsequent

command (first command, second command and/or third command) may reflect the changed position for the menu items.

[00297] In other embodiments, menu items (or hierarchical menu levels) may be excluded based on a particular device or a location of a device. The device on which exclusion is based may be based on any of the one or more devices executing the various software instructions of the methodical user interface control system 1102.

[00298] The exclusion or restriction information may be stored, for example, in storage device 1120 as a data structure. Each device may have an identifier such as a Media Access Control (MAC) address or other unique identifier. The identifier of the device is not limited to a (MAC) address and other identifiers may be used, such as Internet Protocol (IP) address, machine name, etc. In an embodiment, one column in the table may include the identifier, e.g., MAC address. A second column in the table may include the menu item(s) or hierarchical menu levels that are to be excluded from display, respectively, associated with the identifier, e.g., MAC address.

[00299] In other embodiments, instead of a table (or tables), a list of menu items and/or hierarchical menu levels are stored in association with the identifier, e.g., MAC address.

[00300] The device identifiers, such as the MAC address, and the menu item(s) and/or hierarchical menu levels for exclusion may be input by an administrator and/or one or more users with appropriate permissions. This exclusion information may be input when a first MUI module is installed into a device. In other embodiments, the exclusion information may be added after installation and periodically updated.

[00301] In certain embodiments, upon receiving the login historical data or in response to receiving a notification, before issuing any command for displaying any menu (and menu items), the hardware processor executing the input manager 1052 may check the exclusion information in the storage device 1120 to determine if any menu items for the initial display menu or associated with the selection are to be excluded for the device(s).

[00302] In an embodiment, the menu manager 1054 may compare the device identifier with the device identifier(s) listed in the exclusion information. When there is a match, certain menu items are to be excluded from display on the MUI display 206. For example, when the initial display menu (e.g., default menu) or a hierarchical menu level lower than the hierarchical menu level currently being displayed on the MUI display 206 as the current menu, which is associated with a selection, includes one or more menu items listed to be excluded, the menu manager 1054 may

remove the excluded menu item(s) from the menu prior to issuing a display command and then issue the display command with the menu items removed. In this example, the removed menu item will not be displayed on MUI display 206.

[00303] In other embodiments, certain menu items (or hierarchical menu levels) may be excluded based on what hierarchical menu level is currently being displayed as the current menu (in the first portion) or the previous menus (in the second portion). In an embodiment, one column in the exclusion table may include a menu identifier of a hierarchical menu level. A second column in the table may include the menu item(s) or hierarchical menu levels that are to be excluded from display, respectively, associated with the menu identifier.

[00304] The menu identifier represents the hierarchical menu level that is displayable on either the first menu or second menu. The excluded menu items are menu items that are unavailable to be selected from a displayed hierarchical menu level. These menu items may be application specific. In certain embodiments, when a hierarchical menu is displayed, as the current menu in the first portion 204 or the previous menu in the second portion 208, and a selection is made, prior to issuing a command, the menu manager 1054 checks the exclusion information to determine whether any menu items associated with hierarchical menu level which is selected to be display should be excluded. Based on the determination, the menu manager 1054 may remove the excluded menu items from the menu prior to issuing a responsive command and then issue the responsive command with the menu items removed. This exclusion may be carried out, through the issuance of a separate exclusion command and/or instruction, or in the alternative, the exclusion can occur by modifying the first, second, and/or third display commands that provide the available menu item(s) to be displayed.

[00305] In other embodiments, instead of a display or relocation command being issued with the menu items removed, an exclusion command may be issued by the exclusion manager 1058 in combination with the display or relocation command. In this embodiment, the display command would have all of the menu items associated with the menus and the exclusion command would cause the display manager 1050 to delete the executed menu items included in the exclusion command prior to causing the display.

[00306] In other embodiments, a number of menu items to be displayed may be limited by the menu manager 1054 based on a frequency of usage. For example, in an embodiment, the number of menu items may be limited based on a frequency of selection. In certain embodiments, the

frequency can be determined over a predetermined period of time. The frequency of selection can be preset or customizable, and can include, for example, between 50%–80% frequency, although other frequencies of selection are contemplated as well. By limiting display of menu items to include only menu items that are used at greater than a specific threshold frequency, the amount of clutter in the menuing system is reduced and the menuing experience is streamlined.

[00307] In accordance with this embodiment, the input manager 1052 tracks selection of all menu items and stores the same in the storage device 1120. In an embodiment, the list of previously selected menu items is stored in a data structure. For example, the data structure may be a menu item selection table or any other data structures (e.g., those specifically described herein).

[00308] In certain embodiments, a user's or users' selections may be tracked over a preset period of time. The period of time may be one day, one week, one month, or other preset or customizable periods of time. The specific period of time may be based on an application, such as a clinical trial or type of research, type of test, type of organization (e.g., university, corporate), etc. The tracking may be repeated for each preset period of time.

[00309] Each time a notification is received by the hardware processor executing the input manager 1052, within the preset period of time, the input manager 1052 may record, the user identifier, username, email address, and/or account number, the selected menu item and the time and date of the selection. The time and date may be obtained from a timestamp included in the notification. In an embodiment, the user identifier and account number may be obtained from the login history table. In other embodiments, the user identifier and account number may be included in the notification.

[00310] At the end of a specific period of time, the input manager 1052 determines a frequency of selection for each menu item. In an embodiment, the input manager 1052 may determine for a user identifier, the frequency of selection. The frequency of selection is based on the number of times that the menu item was selected verses a total number of selections (within the specified period) by the user identifier.

[00311] In other embodiments, the determination may be based on account number in addition to user identifier. For example, the input manager 1052 may determine a frequency of selection of a menu item by at least two user identifiers having the same account number. In this example, users form teams, where a single account number is associated and/or linked with two or more

user identifiers. In another example, a team can include two or more account numbers associated and/or linked together. In still a further example, teams can be formed whereby N unique users are associated and/or linked with M unique account numbers, where N is greater than M. Identifying user identifiers having the same account number may be achieved using the shared account flag in the registration table in combination with the menu item selection table to determine that the at least two user identifiers made a selection within the period of time.

[00312] For a menu item, a number of selections of the menu item is aggregated for the at least two user identifiers (as determined from the menu item selection table). Similarly, the total number of selections is aggregated for the at least two user identifiers (also as determined from the menu item selection table). The frequency is then based on the aggregated selections of the menu item and the aggregated total selections.

[00313] In other embodiments, the frequency determination may be based on selections where the user identifier is associated with an account number that is linked to other account numbers (e.g., a team of users). In accordance with this embodiment, the input manager 1052 may identify the linked account numbers using the multiple account flag which is set to a specific value when the account number is linked. Once identified, the input manager 1052 may determine the frequency of selection by using selections from a user identifier which is associated with one of the linked account numbers. In this embodiment, selections from other user identifiers or the same user identifier that is not associated with one of the linked account numbers (in the case where the same user identifier is associated with different account numbers) may be ignored (not used in the determination). Similar to above, the input manager 1052 may determine the number of selections of a menu item and the total number of selections to determine the frequency. In other embodiments, the methodical user interface control system 1102 may use selections from any user identifier(s) which is/are associated with one of the linked account numbers for the determination (and may aggregate the selections).

[00314] In other embodiments, the frequency determination may be based on selections of at least two user identifiers where the user identifiers are associated with one or more account numbers that are linked to other accounts. In accordance with this embodiment, the hardware processor executing the input manager 1052 may identify the linked account numbers using the multiple account flag which is set to a specific value when the account number is linked. Once the linked account numbers are identified, the hardware processor executing the input manager

1052 may further identify at least two user identifiers (associated with the linked account numbers) that made selections within the period of time, using the menu item selection table.

[00315] For the identified at least two user identifiers that made a selection, for a menu item, a number of selections of the menu item is aggregated for the at least two user identifiers (as determined from the menu item selection table). Similarly, the total number of selections is aggregated for the at least two user identifiers (also as determined from the menu item selection table). The frequency is then based on the aggregated selections of the menu item and the aggregated total selections.

[00316] In other embodiments, the frequency determination may be based on all selections regardless of the user identifier and/or account numbers. In accordance with this embodiment, the input manager 1052, for each menu item, may determine the number of selections of the respective menu item verses the total number of selections (of any menu item) within the period of time to determine the frequency.

[00317] The frequency described above can be used in conjunction with a limiting command issued by the menu manager 1054. The functionality of the limiting command is similar to the functionality of the exclusion command, as discussed above. The limiting command serves to limit certain menu items to be displayed based on a criterion or two or more criteria. For example, the limiting command can be based on: (a) the frequency with which a user has previously selected the item while he/she was logged into his/her account. In one example, this determination can occur based on a given period of time. In another example, it can be based on the number of times a given user logged into his/her account. Another criterion includes: (b) the frequency with which at least two users have previously selected the item while they were logged into an account. In certain embodiments, this can include an amount of time for a given user or based on the total time the users were logged into their accounts. Alternatively, it can be based on the total number of logins of a given user or the total number of logins in the aggregate. Still further, the criterion can include: (c) the frequency with which a user has previously selected the item while he/she was logged into an account associated with multiple accounts; or (d) the frequency with which at least two users have previously selected the item while they were logged into one or more accounts associated with multiple accounts. For both of these examples, as described with regard to examples (a) and (b), above, the frequency can be based on one or more combinations of the period of time one or more users remained logged into their accounts or the number of account logins.

Still further, the criteria can include: (e) the frequency with which any users have previously selected the item while logged into any account; and/or (f) the frequency with which any users have previously selected the item while logged into any account associated with multiple accounts. In these two examples, the previously selected item can be tracked with the use of a data structure, such as table (or any other data structure described herein), which can be periodically cleared after a given period of time elapses or a certain number of total logins by one or more users occurs. In certain embodiments, the criteria described in (c), (d), and (f), above, can be applied to team accounts, in particular, where users of those accounts are team members with one or more team that are associated with multiple accounts.

[00318] When the determined frequency is greater than or equal to a threshold percentage, menu items may be limited for an immediate subsequent period of time. The threshold may be based on the application. In an embodiment, the threshold percentage may be 50% or more. In other embodiments, the threshold percentage may be 60% or more. In yet other embodiments, the threshold percentage may be 70% or more. In further embodiments, the threshold percentage may be 80% or more. In other embodiments, the threshold may be a percentage range. For example, the threshold percentage may be in a range of between 75% and 85%. The specific percentages have been described herein by way of example, and the threshold percentage is not limited to the same. Any threshold percentage or range may be used.

[00319] In other embodiments, a ratio of selection may be used in place of a frequency of selection. The ratio is defined as the number of selections of the menu item divided by a number of selections of other menu items. For example, ratios of 9:1, 7:1, 5:1, 3:1, or any other suitable ratio may be used.

[00320] In other embodiments, a number of times the menu item is selected may be used in place of a frequency of selection. For example, a specific selection threshold may be used instead of a percentage. The specific selection threshold may be 5, 10, 15, etc.

[00321] Once it is determined that the menu items may be limited, the hardware processor may determine which menu items may be displayed on the MUI display 206 in the immediate subsequent period of time, and which menu item(s) are to be limited. In accordance with embodiments, any menu item determined to have a frequency above the threshold percentage may be displayed (e.g., not limited).

[00322] In further embodiments, a display limitation may be based on menu items having a selection frequency below a certain threshold, e.g., below 50%, 40%, 30%, 20%, 10%, etc.

[00323] In several embodiments, limiting commands can be issued based on various criteria. For example, one or more menu item(s) could be excluded based on menu item(s) being designated as unavailable to a particular user. This can occur, for example, if a particular user has not selected one or more menu item(s) over a certain period of time. Similarly, one or more menu item(s) could be limited based on a menu item(s) being designed as unavailable to an aggregation of two or more users. In this example, the frequency of two or more users selecting or not selecting one or more menu item(s) over a period of time can affect whether a limiting command issues for those menu item(s). Other embodiments contemplate issuing limiting commands in a similar fashion for the previous two examples, but for individual team and/or aggregation of teams (i.e., based on the frequency of selection of menu item(s) by users that are associated with teams). Still further, other embodiments can limit menu items based on a particular machine or aggregation of machines that are executing the computer application that one or more users have logged into.

[00324] In an embodiment, the menu manager 1054 may issue a limiting command to the hardware processor executing the display manager 1050. In accordance with this embodiment, the limiting command may include the menu items determined to have a frequency above the threshold percentage. The limiting command may be issued in conjunction with the one or more display commands. Upon receipt of the display command and the limiting command, the display manager 1050 may delete or remove menu items included in the display command that are not also included in the limiting command prior to causing the menu items to be displayed on the MUI display 206.

[00325] In other embodiments, the limiting command may include menu items other than the menu items determined to have a frequency above the threshold percentage. Upon receipt of the display command and the limiting command, the display manager 1050 may delete or remove menu items included in the display command that are also included in the limiting command prior to causing the menu items to be displayed on the MUI display 206.

[00326] In other embodiments, instead of a separate limiting command, the display command may be modified by the menu manager 1054 to remove menu items other than the menu items determined to have the frequency above the threshold percentage.

[00327] Through use of the limiting command, menu items (user-selectable options or choices) may be limited to fewer than a number of menu items on the first menu and the second menu. For

example, the first menu may include nine menu items, but the use of a limiting command restricts the total number of menu items to be displayed to be less than nine. For example, a total number of menu items (user-selectable options) may be fewer than or equal to seven (or fewer than the seven), fewer than or equal to five, fewer than or equal to three, or fewer than or equal to any other number. The number of menus (limited number) described herein is just an example, and the number may be any number selected to provide a limited display to avoid or prevent the user from being overwhelmed with choices. In embodiments, menu items that are excluded from display due to a limiting command are provided in the advanced context menu 270. In embodiments, menu items excluded from display based on a limiting number may be selected according to frequency of selection.

[00328] In some embodiments, if after determining the number of menu items that has a selection frequency greater than the threshold percentage and the number of menu items is greater than the limiting number, e.g., seven, the menu manager 1054 may increase the threshold percentage to lower the number of menu items that has a selection frequency greater than the threshold percentage. Thus, the menu manager 1054 may be configured to select and display a specific number of menu items having the highest selection frequencies.

[00329] In an embodiment, the limiting function may operate as follows, as applied to any type of MUI module. The threshold percentage may be used to determine which menu items will be displayed (e.g., not limited). For example, a threshold percentage of 90% or 80% may be used, meaning that only menu items with a selection frequency higher than 90% or 80% are displayed. In an example, the selection frequency may be applied based on user login sessions, meaning that only menu items used 90% or 80% of the time that a user logs in are displayed. The limiting function may be applied to one or more menu levels, i.e., to a first menu level, a second menu level, etc. In some embodiments, the threshold may vary based on the menu level (e.g., lower levels may have lower frequency requirements for display - as there are often a greater number of options at lower levels, they may be selected less often.) Those menu items that do not meet the threshold (e.g., used 10% or less, or used 20% or less) are displayed in the advanced context menu, which changes according to the current menu being displayed. In this manner, the user's choices are limited to those that are most frequently used throughout the MUI, permitting significantly faster navigation by the user. In certain embodiments, the choices that are excluded as described above, can be made available exclusively with the advanced context menu. Thus, for the 90%

example, if only 90% of the available menu meets the threshold, only those will be displayed in the current menu while the balance (10% in this example) will be displayed in the advanced context menu in response to the advanced context menu selector (also referred to throughout also as the advanced selector or advanced context selector).

[00330] The 90% / 10% and/or 80% / 20% values are exemplary only and other values may be selected according to the MUI module being implemented. In an example, the limiting function may also be based on a default protocol as compared to a user customized protocol. For example, a vendor may market an assay kit including a standard protocol that further permits customer modifications. The standard protocol options may be included in the available menu items displayed in the active portion as the user moves through the menuing system, while the available customer modifications may be displayed in the advanced context menu. This division of menu items may be adjusted based on actual user operation after that particular assay kit has been used several times by a user.

[00331] Similarly, by using the limiting command, menu items (user-selectable options) may be limited to fewer than a number of menu items on the first menu, the second menu and the third menu.

[00332] In certain embodiments, when the period of time expires, the menu item selection table may delete the selection history for a new determination. In this example, the menu item(s) that were previously excluded will again be made available.

[00333] In embodiments, the MUI may provide team integration via communications between multiple MUI modules. An integrated system managed by systems consistent with embodiments hereof may be managed by multiple MUI modules configured for completing different tasks by different operators. For example, using the example of a laboratory information management system (LIMS), an admin console module, an experimental design module, an inventory control module, an experimental analysis module, and an experimental procedure module may be provided. The admin console module may provide the features and functionality to manage the various users, operators, instruments, and teams. The experimental design module may permit one or more members of a team to design experiments that other members of the team will conduct. The inventory control module may permit other team members to review inventory and order more consumables, taking into account experimental history and future scheduled experiments. The experimental procedure module may permit team members responsible for running the

experiments to access the already designed experiments and implement them, through interaction between the MUI, the operator, and external systems. Finally, the experimental analysis module may permit other team members to access results of experiments after they have been conducted. Based on user and team set-up prepared via the admin console, each user may log-in to the system and be provided with access to the requisite modules for completing the tasks that they are responsible for. In embodiments, the requisite modules may be installed on computing devices in appropriate locations for completing tasks (i.e., an experimental procedure module may be installed on a device connected to a laboratory instrument while an admin console module may be installed on a desktop device). Accordingly, the systems provided herein permit the integration of workflows between multiple team members through the use of a single and consistent interface.

[00334] In embodiments, the display manager 1050 may be configured to provide one or more icons or animations to designate a “working” status of the methodical user interface control system 1102. When the methodical user interface control system 1102 is processing, a working status indication is provided to alert a user that processing is occurring to prevent impatience. In an embodiment, a working status indication may be provided via a light fountain display presented in a portion of the screen not occupied by active or historical portions. For example, a bottom portion of the screen, centered beneath the active portion, may be used for a light fountain display. The light fountain may provide a series of cascading bars shown in colors consistent with the remainder of the MUI. In an embodiment, the cascading bard may be presented in white and various shades of blue. In an embodiment, the bars are presented in four rows of elongated bars. Each row may contain, for example, a plurality of bars between two and twenty of varying lengths. When the system is processing, the bars may flash on and off in different shades of white and blue and in different lengths, giving the impression of a waterfall or light fountain.

[00335] Embodiment described herein further include methods of designing user interface system. For example, such methods may include the design of MUIs consistent with embodiments hereof. Methods of designing user interface systems may include generating hierarchical menu trees as described herein. Hierarchical menu trees may include a series of menus, each including menu items that lead to a subsequent series of menus. Methods of designing user interface systems may further include selecting execution menus to terminate branches of the hierarchical menu tree, wherein the execution menus are configured to execute one or more commands within the software, to provide one or more sets of instructions to a user, and/or to output one or more

commands to a connected device, system, instrument, or machine. Methods of designing user interface systems may further include configuring each of the menus in the hierarchical menu tree with one or more display modes, including at least an active display mode for display in an active portion of a user interface and an historical display mode for display in an historical portion of user interface. Further aspects of methods of user interface design may further include design methods for any of the menu functionalities described herein.

[00336] In further embodiments, MUIs consistent with the disclosure may provide integrated help options during hierarchical menu navigation. A user may request help with a given menu by pressing a particular key combination and/or by accessing a help option displayed by the advanced context menu. Integrated help options may include one or more dialog boxes designed to provide explanations to a user regarding the options presented. As discussed above, the MUI provides a large amount of blank or background space. Thus, help options may be presented as pop-ups or dialog boxes pointing to the portions of the MUI for which a user seeks help without compromising the original MUI display. In embodiments, enabling the help functionality may cause a dialog box to appear as a user hovers over or otherwise indicates any item in the MUI.

[00337] In further embodiments, the MUI historical portion may be further adapted to display menu items of menus subsequent to the current menu. For example, as a user navigates a current menu, they may, for example, scroll a vertical wheel, causing different menu items to be highlighted or emphasized. A submenu related to the highlighted menu item may be displayed in the historical portion to provide a visual representation of a subsequent menu to the current menu including future items that can be subsequently selected.

[00338] In embodiments, as discussed above, the first active portion and the second historical portion are each adapted to for consistent display in a same portion of the MUI. Although the positioning of each of these portions is not limited to a specific place on the MUI, in certain embodiments, the location, once selected, is maintained. Accordingly, the active portion of the MUI display is adapted to be consistently displayed within a first same area of the UI display to optimize a user's focus while interacting with the UI display and the historical portion of the MUI display is adapted to be consistently displayed within a second same area of the UI display to optimize a user's focus while interacting with the UI display.

[00339] The prior description provides example menu configurations for providing a UI display of multiple menus in a hierarchical menu tree. FIGS. 2D-2M provide additional examples of menu

display configurations. The following menu display configurations may be used, without limitation, in any combination with each other and with the menu configurations previously disclosed. For example, selection of a particular menu item anywhere in the hierarchical menu tree may cause the processor to execute commands to cause the UI display to shift to any of the menu configurations described herein. In particular, specific menu display configurations may be associated with specific menu selections.

[00340] FIG. 2D shows another example of a menu display configuration in one embodiment. FIG. 2D illustrates a two wheel configuration in which the first wheel option has sub-options in a second wheel. For instance, selecting an option in a first wheel of options displays in the second wheel, the sub-options associated with the selected option. In an embodiment, a first portion 214 of the display may initially display the first wheel, and responsive to a selection of an option from the first wheel, the first wheel with its options may be relocated to a second portion 216 adjacent to the first portion. The first portion may then display the second wheel with sub-options to the first option, for example, in a parallel fashion (first wheel displayed in parallel to the second wheel in the same visual orientation).

[00341] In further embodiments of this embodiment, both the first wheel and the second wheel may be displayed in the first portion 214 of the MUI display 206. The first wheel may be displayed in a first sub-portion of the first portion 214 and the second wheel may be displayed in a second sub-portion of the first portion 214. As used herein, sub-portions may be divided portions of a larger portion. Sub-portions may also be used interchangeably with sub-sections. In embodiments, selection of a menu item in the first wheel may be caused simply by clicking on any menu item in the first wheel or by rotating any menu item in the first wheel to a prominent, emphasized position. Selection of an item from a first menu on the first wheel may cause the second menu displayed on the second wheel to be revised accordingly. In still further embodiments of this embodiment, the first portion 214 may be split into more than two sub-portions, with each sub-portion including a wheel displaying a corresponding menu. Thus, three wheels may display a first menu, a second menu, and a third menu, representing different levels of a hierarchical menu tree. In another example, three wheels may display a second, third, and fourth menu. Other examples may include any number of wheels.

[00342] In further embodiments, multiple wheels may be displayed in multiple sub-portions of the first portion 204 to permit the user to select from multiple menus at a same hierarchical menu

level. For example, selection of a specific menu item at one menu level may lead to the display of multiple submenus at the same level. Thus, selection of an item at a second menu level may lead to display of multiple third menus, each containing a plurality of third menu items. In embodiments, the multiple submenus displayed may be execution menus, permitting a user to make multiple execution menu selections concurrently. In embodiments, where multiple submenus are displayed, the multiple submenus may be related or otherwise associated with one another.

[00343] FIG. 2E shows yet another example of a menu display configuration in one embodiment. In this display configuration, two wheels are compressed into one wheel. Wheel option has sub-options which are expressed within the one wheel associated with the active wheel option. In this configuration, the first portion and the second portion of the display overlap but still all menu items are visible (or can be made visible by expanding in case of collapsed items, sliding or rotating a wheel of items). For instance, the second wheel of options may be displayed within the first wheel. The first wheel of options may be rotatable in one direction (e.g., vertically up and down) while the second wheel of options may be rotatable in another direction (e.g., horizontally sides ways, left and right). Selected path is also made visible in the second portion. For instance, selecting 'Sub-option 2' shown in the display moves that selected option below the 'First Wheel Option 1'.

[00344] FIGS. 2F-2G show still yet another example of a menu display configuration in one embodiment. The figures show switching of wheel options from horizontal to vertical. FIG. 2F shows a menu of options displayed in a graphical wheel, for example, whose displayed options are rotatable in horizontal direction (left and right). The wheel is displayed in a first portion of a graphical user interface display. Upon selecting an option (a menu item in the list of options), the graphical wheel is switched to a vertically rotatable wheel. For instance, the wheel is moved or relocated to a second portion of the graphical user interface display, and the first portion of the graphical user interface display now displays a list of sub-options related to the option selected in the previous menu of options.

[00345] In one embodiment, the second portion of the display may display up to a threshold number of menu levels, for example, after which a different visualization configuration may be employed for displaying the past menu levels, to keep the second portion from growing too large.

[00346] For instance, referring to FIG. 2C, if there are more than a threshold number of menu levels (as an example, FIG. 2C shows 2 levels (202, 210)), a visualization mechanism may be employed that is able to visualize all past menu levels without having to grow the second portion of the display (e.g., FIG. 2C at 208). Consider for example, a threshold number to be 3. In that example, the second portion of the display may show 3 menu levels. When an additional choice for the next level is made (e.g., 4-th menu level), the second portion may show the most recent past 3 selections (the bottom 3 levels), with the items in the second portion made scrollable up and down. So, in this example, the first menu level choice is visible by scrolling on the second portion. As another example, the second portion may always show the top 2 levels, i.e., the first 2 decisions, and the last decision. In this way, the user is shown an overall context of a workflow, for instance, top-down. Tapping or scrolling the second portion allows the user to expand out the menu items, for example, like an accordion.

[00347] In another aspect, a search function may be provided associated with a wheel. Search keywords allow for filtering the wheel options available to the user. The search function helps in handling a long wheel of options or multi-wheel of options, which may take a long time to navigate.

[00348] FIGS. 2H-2J show an example of the first portion and the second portion displayed as a series of concentric circles in one embodiment. Referring to FIG. 2H, a dial 220 may be rotated clockwise or counterclockwise to view in an option window 218, a menu item or item to select. Tapping on the area of the dial (e.g., circle) 220 selects the option. Selecting an option, for example, viewed via an option window 218, transitions the user interface to a configuration shown in FIG. 2I. For instance, in FIG. 2I, concentric dials expand inside out, showing another concentric circle to represent another level (e.g., sub-level) of menu items or paths. Sub-options may be viewed via an option window 222 on that circle 224 (also referred to as a dial) by rotating that dial 224 clockwise or counterclockwise. Selection of an option in that level (shown as sub-option 'n') 222 may be made by tapping on the area of that circle 224 (that is non-overlapping with the inner circle or dial 220). In another embodiment, selecting an option from the dial or circular menu user interface (for example, as shown in FIG. 2H) may transition the user interface state to the configuration shown in FIG. 2J. For instance, the next level of option selection billows out from the selected option, expanding the dial to show another inner dial 224 with an option window 222. In an embodiment, the number of options that can be viewed on an option window (e.g., 218 and

222) need not be limited, such that an unlimited number of options may be shown and selected as applicable for an application.

[00349] In an embodiment, an option window (e.g., 218) may be enlarged to show a selected option (e.g., as highlighted) and one or more unselected options, for example, an unselected option that appears before the selected option and another unselected option that appears after the selected option.

[00350] In another aspect, an option window (e.g., 219) may show more than one item or option at a time, for instance, 3 menu items or options. In this example, tapping on a menu item in the option window selects the option. After a selection is made, the selected option may be displayed in a highlighted format or another differentiating format, for instance, to distinguish the selected option from unselected options appearing in the option window.

[00351] In another embodiment, the relocation command may specify that the second portion is concentric with the first portion and that the relocated menu be displayed adjacent to the first portion (and concentric) where the first portion and the second portion are to be displayed on the MUI display 206 as a series of concentric circles. For example, the first portion may be displayed as the center circle of the series of concentric circles, and a relocated menu level(s) of the hierarchy being displayed as the circles outside or surrounding the center circle.

[00352] FIG. 2K shows a tree type of menu levels in an embodiment.

[00353] The hierarchical menu tree shown in FIG. 2K includes a first menu of menu items, a second menu of submenu items, a third menu of sub-submenu items, and four execution menus. One execution menu is associated with submenu item 1 and three more are associated with sub-submenu items 1-3. Selection of menu item 1 from the first menu leads to display of the second menu of submenu. Selection of submenu item 1 leads to an execution menu for submenu item 1 in which process parameters may be selected. Selection of submenu item 2 leads to a third menu of sub-submenu items. Selection of any one of sub-submenu items 1-3 leads to execution menus for these respective third menu items.

[00354] FIG. 2L shows another example of a menu display configuration in one embodiment. A graphical element 242 such as a wheel or a slider (or another graphical element) is displayed in a portion 240 of a display screen. The graphical element 242, e.g., a wheel, is ordered with the most “n” recent items first (reverse chronological) 244 with a search function such a search box or area 246 next followed by a list, for example, an alphanumerically sorted list, of the all of the menu

items 248. In another embodiment, the menu items shown at 248 appear as indexed, for instance, as a search term is entered in the search box 246. The entire wheel 242 is made scrollable. For instance, a user can scroll through the entire wheel 242 or enter a search string in the search box 246. Entering a search term in the search area 246 displays menu items that match the search term as a search character is entered. For instance, on each character entered, one or more menu items closest to matching the search character(s) are indexed at 248. The wheel 240 is bifurcated into two independent wheels, one that displays recently chosen menu items 244 and another that displays indexed list or all menu items 248. The two wheels 244 and 248 are scrollable or movable independently from one another. So, for example, the entire wheel 242 is made to move or scroll as one wheel. Responsive to receiving or detecting an entry of a search term or character in the search area 246, the wheel is bifurcated into two separate wheels 244 and 248, which can be independently scrolled. One of the two separate wheels, e.g., 248, shows a filtered list of menu items based on the search.

[00355] FIGS. 2M-2O show examples of scrollable wheels that scroll or slide from a first menu item to a last menu item and back from the last menu item to the first menu item. In this embodiment, a graphical element (e.g., a wheel or slider) that shows the menu items do not revolve or rotate around fully but stops at the last menu item or the first menu item (if rotating from the last menu item). In this way, for example, the beginning and end of the menu are always apparent because the two do not merge or connect. This technique reduces computer processing cycle time because the wheel and/or the slider is able to convey (and user is able to immediately understand) the full menu of choices with clear indication as to where or which is the first menu item and where or which is the last menu item in the choices presented by the wheel and/or the slider such that the wheel or the slider need not repeatedly scroll in an attempt to determine which menu item is the first and which is the last, or to determine whether all menu items have been visited.

[00356] In embodiments, the wheel and/or the slider need not rotate fully; for example, do not make a full revolution or complete circle. For instance, the wheel and/or the slider rotates or slides from a beginning menu item to an ending menu item, and reverses to rotate or slide back from the ending menu item to the beginning menu item. In this way, for example, the beginning and end of the menu are always apparent because the two are spaced apart as to not merge or come together. This technique decreases processing time because the wheel and/or the slider is able to convey (and user is able to immediately understand) the full menu of choices with clear indication as to

where or which is the first menu item and where or which is the last menu item in the choices presented by the wheel and/or the slider. Further, as the wheel and/or slider rotates, selectable choices can be displayed in a more prominent fashion, such as using larger text, bolder font, etc. Choices that were previously selectable when the wheel and/or slider was rotated/slided to a different position or will be selectable as the wheel and/or slider continues to rotate/slide, can be displayed in a less prominent fashion, such as by shrinking or fading the text. In one embodiment, the more prominently displayed choices can be displayed to appear as if they are closer to the user vis-à-vis the less prominent choices.

[00357] Referring to FIG. 2M, the first menu item 252 is shown in the center of the wheel (or slider) 250. A menu item shown at the center may be shown in highlighted format (e.g., bigger characters, different color font, etc.). Blank space appears before the first menu item (e.g., above the center of the wheel where the first menu item is displayed). The next menu items (e.g., 254, 256) appear adjacent to (e.g., below) the first menu item. Scrolling the wheel (e.g., in vertical direction) shows additional menu items, e.g., as shown at FIG. 2N. For instance, shown in FIG. 2N, next menu items are shown as the wheel 250 is scrolled up. FIG. 2O shows the last menu item at the center of the wheel, with the previous menu items appearing adjacent to (e.g., above) the last menu item. The wheel or the slider 250 in this embodiment does not rotate around to show the first menu item after the last menu item 258. Instead the wheel stops rotating at the last menu item 258. Below the last menu item 258 shows blank space. Similarly, navigating back (e.g., scrolling the wheel in the opposite direction) shows the previous menu items up to the first menu item.

[00358] While the example graphical wheel shown in FIGS. 2M-2O illustrates a vertical wheel, a horizontal wheel would function in similar manner. For instance, a first menu item may appear at a center of a horizontal wheel with the next menu items appearing horizontally adjacent to the first menu item (e.g., right of the center). Scrolling the wheel to the left in this example would display additional menu items. When the last menu item is reached by scrolling, that last menu item appears at the center with blank space beyond the last menu item (e.g., to the right of the last menu item). In another aspect, the orientation of the rotation may be reversed: e.g., with vertical wheel, scrolling down (instead of up) to navigate from the first to the last menu item; with horizontal wheel, scrolling right to navigate from the first to the last menu item. The number of menu items (options) shown on a wheel at one time is configurable, for example, based on screen

size and/or area of the screen allocated for the wheel, etc., and is not limited to 6 items shown in FIGS. 2N.

[00359] A non-limiting application of such a user interface is in selecting a channel to watch on television (TV). Broader categories may be displayed on top horizontal area with finer categorizations stacked below, and leaf item may be displayed vertically, for example, on a vertical wheel. For example, referring to FIG. 2E, the 'Wheel Option 1' may represent a genre and the 'Sub-options 1' may represent shows and/or movies organized in a grid.

[00360] In an embodiment, the methodical user interface control system 1102 provides an interface to a user for the running of a process. A process may include conducting an experiment, performing one or more manufacturing operations, or any other procedure.

[00361] The following describes in detail various instructions for conducting experiments consistent with embodiment hereof. Instructions for conducting an experiment may be for manipulating, designing, performing, reviewing, measuring, analyzing, storing, and conducting any other task related to the experiment. The experiment may be but is not limited to one or more assays. The methodical user interface control system 1102 may be incorporated into and/or associated with an assay system and provide commands to generate a MUI display 206 for the system. The MUI display 206, in response to the commands is able to display or provide a visual representation of a path of a workflow and/or menu items for the assay. The assays may include one or more electrochemiluminescence (ECL) assays.

[00362] The methods of the present embodiments may be used in conjunction with a variety of assay devices and/or formats. The assay devices may include, e.g., assay modules, such as assay plates, cartridges, multi-well assay plates, reaction vessels, test tubes, cuvettes, flow cells, assay chips, lateral flow devices, etc., having assay reagents (which may include targeting agents or other binding reagents) added as the assay progresses or pre-loaded in the wells, chambers, or assay regions of the assay module. These devices may employ a variety of assay formats for specific binding assays, e.g., immunoassay or immunochromatographic assays. Illustrative assay devices and formats are described herein below. In certain embodiments, the methods of the present embodiments may employ assay reagents that are stored in a dry state and the assay devices/kits may further comprise or be supplied with desiccant materials for maintaining the assay reagents in a dry state. The assay devices preloaded with the assay reagents can greatly improve the speed and reduce the complexity of assay measurements while maintaining excellent stability during

storage. The dried assay reagents may be any assay reagent that can be dried and then reconstituted prior to use in an assay. These include, but are not limited to, binding reagents useful in binding assays, enzymes, enzyme substrates, indicator dyes and other reactive compounds that may be used to detect an analyte of interest. The assay reagents may also include substances that are not directly involved in the mechanism of detection but play an auxiliary role in an assay including, but not limited to, blocking agents, stabilizing agents, detergents, salts, pH buffers, preservatives, etc. Reagents may be present in free form or supported on solid phases including the surfaces of compartments (e.g., chambers, channels, flow cells, wells, etc.) in the assay modules or the surfaces of colloids, beads, or other particulate supports.

[00363] A wide variety of solid phases are suitable for use in the methods of the present embodiments including conventional solid phases from the art of binding assays. Solid phases may be made from a variety of different materials including polymers (e.g., polystyrene and polypropylene), ceramics, glass, composite materials (e.g., carbon-polymer composites such as carbon-based inks). Suitable solid phases include the surfaces of macroscopic objects such as an interior surface of an assay container (e.g., test tubes, cuvettes, flow cells, cartridges, wells in a multi-well plate, etc.), slides, assay chips (such as those used in gene or protein chip measurements), pins or probes, beads, filtration media, lateral flow media (for example, filtration membranes used in lateral flow test strips), etc.

[00364] Suitable solid phases also include particles (including but not limited to colloids or beads) commonly used in other types of particle-based assays e.g., magnetic, polypropylene, and latex particles, materials typically used in solid-phase synthesis e.g., polystyrene and polyacrylamide particles, and materials typically used in chromatographic applications e.g., silica, alumina, polyacrylamide, polystyrene. The materials may also be a fiber such as a carbon fibril. Microparticles may be inanimate or alternatively, may include animate biological entities such as cells, viruses, bacterium and the like.

[00365] The particles used in the present method may be comprised of any material suitable for attachment to one or more binding partners and/or labels, and that may be collected via, e.g., centrifugation, gravity, filtration or magnetic collection. A wide variety of different types of particles that may be attached to binding reagents are sold commercially for use in binding assays. These include non-magnetic particles as well as particles comprising magnetizable materials which

allow the particles to be collected with a magnetic field. In one embodiment, the particles are comprised of a conductive and/or semi conductive material, e.g., colloidal gold particles.

[00366] The microparticles may have a wide variety of sizes and shapes. By way of example and not limitation, microparticles may be between 5 nanometers and 100 micrometers. Preferably microparticles have sizes between 20 nm and 10 micrometers. The particles may be spherical, oblong, rod-like, etc., or they may be irregular in shape.

[00367] The particles used in the present method may be coded to allow for the identification of specific particles or subpopulations of particles in a mixture of particles. The use of such coded particles has been used to enable multiplexing of assays employing particles as solid phase supports for binding assays. In one approach, particles are manufactured to include one or more fluorescent dyes and specific populations of particles are identified based on the intensity and/or relative intensity of fluorescence emissions at one or more wave lengths. This approach has been used in the Luminex xMAP systems (see, e.g., U.S. Patent No. 6,939,720) and the Becton Dickinson Cytometric Bead Array systems. Alternatively, particles may be coded through differences in other physical properties such as size, shape, imbedded optical patterns and the like.

[00368] The methods of the embodiments can be used with a variety of methods for measuring the amount of an analyte and, in particular, measuring the amount of an analyte bound to a solid phase. Techniques that may be used include, but are not limited to, techniques known in the art such as cell culture-based assays, binding assays (including agglutination tests, immunoassays, serology assays, nucleic acid assays such as hybridization assays, etc.), enzymatic assays, colorimetric assays, etc. Other suitable techniques will be readily apparent to one of average skill in the art. Some measurement techniques allow for measurements to be made by visual inspection, others may require or benefit from the use of an instrument to conduct the measurement.

[00369] Methods for measuring the amount of an analyte include label free techniques, which include but are not limited to i) techniques that measure changes in mass or refractive index at a surface after binding of an analyte to a surface (e.g., surface acoustic wave techniques, surface plasmon resonance sensors, ellipsometric techniques, etc.), ii) mass spectrometric techniques (including techniques like MALDI, SELDI, etc. that can measure analytes on a surface), iii) chromatographic or electrophoretic techniques, and iv) fluorescence techniques (which may be based on the inherent fluorescence of an analyte), etc.

[00370] Methods for measuring the amount of an analyte also include techniques that measure analytes through the detection of labels which may be attached directly or indirectly (e.g., through the use of labeled binding partners of an analyte) to an analyte. Suitable labels include labels that can be directly visualized (e.g., particles that may be seen visually and labels that generate a measurable signal such as light scattering, optical absorbance, fluorescence, chemiluminescence, electrochemiluminescence, radioactivity, magnetic fields, etc.). Labels that may be used also include enzymes or other chemically reactive species that have a chemical activity that leads to a measurable signal such as light scattering, absorbance, fluorescence, etc. The use of enzymes as labels has been well established in Enzyme-Linked ImmunoSorbent Assays, also called ELISAs, Enzyme ImmunoAssays or EIAs. In the ELISA format, an unknown amount of antigen is affixed to a surface and then a specific antibody is washed over the surface so that it can bind to the antigen. This antibody is linked to an enzyme, and in the final step a substance is added that the enzyme converts to a product that provides a change in a detectable signal. The formation of product may be detectable, e.g., due a difference, relative to the substrate, in a measurable property such as absorbance, fluorescence, chemiluminescence, light scattering, etc. Certain (but not all) measurement methods that may be used with solid phase binding methods according to the embodiments may benefit from or require a wash step to remove unbound components (e.g., labels) from the solid phase. Accordingly, the methods of the embodiments may comprise such a wash step.

[00371] Methods disclosed herein may be performed manually, using automated technology, or both. Automated technology may be partially automated, e.g., one or more modular instruments, or a fully integrated, automated instrument.

[00372] Example automated systems are discussed and described in International Patent Appl. Pub. Nos. WO 2018/017156 and WO 2017/015636 and International Patent Appl. Pub. No. WO 2016/164477, each of which is incorporated by reference herein in its entirety.

[00373] Automated systems (modules and fully integrated) on which the methods herein may be carried out may comprise the following automated subsystems: computer subsystem(s) that may comprise hardware (e.g., personal computer, laptop, hardware processor, disc, keyboard, display, printer), software (e.g., processes such as drivers, driver controllers, and data analyzers), and database(s); liquid handling subsystem(s), e.g., sample handling and reagent handling, e.g., robotic pipetting head, syringe, stirring apparatus, ultrasonic mixing apparatus, magnetic mixing

apparatus; sample, reagent, and consumable storing and handling subsystem(s), e.g., robotic manipulator, tube or lid or foil piercing apparatus, lid removing apparatus, conveying apparatus such as linear and circular conveyors and robotic manipulators, tube racks, plate carriers, trough carriers, pipet tip carriers, plate shakers; centrifuges, assay reaction subsystem(s), e.g., fluid-based and consumable-based (such as tube and multi well plate); container and consumable washing subsystem(s), e.g., plate washing apparatus; magnetic separator or magnetic particle concentrator subsystem(s), e.g., flow cell, tube, and plate types; cell and particle detection, classification and separation subsystem(s), e.g., flow cytometers and Coulter counters; detection subsystem(s) such as colorimetric, nephelometric, fluorescence, and ECL detectors; temperature control subsystem(s), e.g., air handling, air cooling, air warming, fans, blowers, water baths; waste subsystem(s), e.g., liquid and solid waste containers; global unique identifier (GUI) detecting subsystem(s) e.g., 1D and 2D bar-code scanners such as flat bed and wand types; sample identifier detection subsystem(s), e.g., 1D and 2D bar-code scanners such as flat bed and wand types. Analytical subsystem(s), e.g., chromatography systems such as high-performance liquid chromatography (HPLC), fast-protein liquid chromatography (FPLC), and mass spectrometer can also be modules or fully integrated. Automated systems consistent with embodiments hereof may be controlled and/or managed by the methodical user interface control system 1102.

[00374] Systems or modules that perform sample identification and preparation may be combined with (or be adjoined to or adjacent to or robotically linked or coupled to) systems or modules that perform assays and that perform detection or that perform both. Multiple modular systems of the same kind may be combined to increase throughput. Modular system(s) may be combined with module(s) that carry out other types of analysis such as chemical, biochemical, and nucleic acid analysis.

[00375] The automated system may allow batch, continuous, random-access, and point-of-care workflows and single, medium, and high sample throughput.

[00376] The system may include, for example, one or more of the following devices: plate sealer (e.g., Zymark), plate washer (e.g., BioTek, TECAN), reagent dispenser and/or automated pipetting station and/or liquid handling station (e.g., TECAN, Zymark, Labsystems, Beckman, Hamilton), incubator (e.g., Zymark), plate shaker (e.g., Q.Instruments, Inheco, Thermo Fisher Scientific), compound library or sample storage and/or compound and/or sample retrieval module. One or more of these devices is coupled to the apparatus via a robotic assembly such that the entire

assay process can be performed automatically. According to an alternate embodiment, containers (e.g., plates) are manually moved between the apparatus and various devices (e.g., stacks of plates).

[00377] The automated system may be configured to perform one or more of the following functions: (a) moving consumables such as plates into, within, and out of the detection subsystem, (b) moving consumables between other subsystems, (c) storing the consumables, (d) sample and reagent handling (e.g., adapted to mix reagents and/or introduce reagents into consumables), (e) consumable shaking (e.g., for mixing reagents and/or for increasing reaction rates), (f) consumable washing (e.g., washing plates and/or performing assay wash steps (e.g., well aspirating)), and (g) measuring ECL in a flow cell or a consumable such as a tube or a plate. The automated system may be configured to handle individual tubes placed in racks, multiwell plates such as 96 or 384 well plates.

[00378] Methods for integrating components and modules in automated systems as described herein are well-known in the art, see, e.g., Sargeant et al., Platform Perfection, Medical Product Outsourcing, May 17, 2010.

[00379] In embodiments, the automated system is fully automated, is modular, is computerized, performs *in vitro* quantitative and qualitative tests on a wide range of analytes and performs photometric assays, ion-selective electrode measurements, and/or electrochemiluminescence (ECL) assays. In embodiments, the system includes the following hardware units: a control unit, a core unit and at least one analytical module.

[00380] In embodiments, the control unit uses a graphical user interface to control all instrument functions, and is comprised of a readout device, such as a monitor, an input device(s), such as keyboard and mouse, and a personal computer using, e.g., a Windows operating system. In embodiments, the core unit is comprised of several components that manage conveyance of samples to each assigned analytical module. The actual composition of the core unit depends on the configuration of the analytical modules, which can be configured by one of skill in the art using methods known in the art. In embodiments, the core unit includes at least the sampling unit and one rack rotor as main components. Conveyor line(s) and a second rack rotor are possible extensions. Several other core unit components can include the sample rack loader/unloader, a port, a barcode reader (for racks and samples), a water supply and a system interface port. In embodiments, the analytical module conducts ECL assays and includes a reagent area, a measurement area, a consumables area and a pre-clean area.

[00381] The methods of the invention may be applied to singleplex or multiplex formats where multiple assay measurements are performed on a single sample. Multiplex measurements that can be used with the invention include, but are not limited to, multiplex measurements i) that involve the use of multiple sensors; ii) that use discrete assay domains on a surface (e.g., an array) that are distinguishable based on location on the surface; iii) that involve the use of reagents coated on particles that are distinguishable based on a particle property such as size, shape, color, etc.; iv) that produce assay signals that are distinguishable based on optical properties (e.g., absorbance or emission spectrum) and/or v) that are based on temporal properties of assay signal (e.g., time, frequency or phase of a signal).

[00382] The invention includes methods for detecting and counting individual detection complexes. In embodiments, the surface comprises a plurality of binding domains, and each analyte forms a complex in a different binding domain of the plurality of binding domains. In embodiments, the surface is a particle. In embodiments, the surface is a bead. In embodiments, the surface is a plate. In embodiments, the surface is a well in a multi-well array. In embodiments, the surface comprises an electrode. In embodiments, the electrode is a carbon ink electrode. In embodiments, each binding domain for each analyte of the one or more additional analytes is on a separate surface, and the surfaces are beads in a bead array. In embodiments, each binding domain for each analyte of the one or more additional analytes is on a single surface, and the binding domains form the elements of a capture reagent array on the surface. In embodiments, the surface comprises an electrode and the detection step of the method comprises applying a potential to the electrode and measuring electrochemiluminescence. In embodiments, applying a potential to the electrode generates an electrochemiluminescence signal.

[00383] In a specific embodiment, the surface comprises a plurality of capture reagents for one or more analytes that are present in a sample, and the plurality of capture reagents are distributed across a plurality of resolvable binding regions positioned on the surface. Under the conditions used to carry out and analyze a measurement, a “resolvable binding region” is the minimal surface area associated with an individual binding event that can be resolved and differentiated from another area in which an additional individual binding event is occurring. Therefore, the method consists of binding one or more analytes to one or more capture reagents on the surface, determining the presence or absence of the analytes, in a plurality of resolvable binding regions on

the surface, and identifying the number of resolvable binding regions that contain an analyte of interest and/or the number of domains that do not contain analyte.

[00384] The resolvable binding regions can be optically interrogated, in whole or in part, i.e., each individual resolvable binding region can be individually optically interrogated and/or the entire surface comprising a plurality of resolvable binding regions can be imaged and one or more pixels or groupings of pixels within that image can be mapped to an individual resolvable binding region. A resolvable binding region may also be a microparticle within a plurality of microparticles. The resolvable binding regions exhibiting changes in their optical signature can be identified by a conventional optical detection system. Depending on the detected species (e.g., type of fluorescence entity, etc.) and the operative wavelengths, optical filters designed for a particular wavelength can be employed for optical interrogation of the resolvable binding regions. In embodiments where optical interrogation is used, the system can comprise more than one light source and/or a plurality of filters to adjust the wavelength and/or intensity of the light source. In some embodiments, the optical signal from a plurality of resolvable binding regions is captured using a CCD camera. Other non-limiting examples of camera imaging systems that can be used to capture images include charge injection devices (CIDs), complementary metal oxide semiconductors (CMOSs) devices, scientific CMOS (sCMOS) devices, and time delay integration (TDI) devices, as will be known to those of ordinary skill in the art. In some embodiments, a scanning mirror system coupled with a photodiode or photomultiplier tube (PMT) can be used for imaging.

[00385] In embodiments, the binding of each analyte to its corresponding capture reagent is performed in parallel by contacting the one or more surfaces with a single liquid volume comprising a plurality of analytes. In embodiments, the plurality of analytes includes the analyte and one or more additional analytes. In embodiments, each step of the method is carried out for each analyte in parallel. In embodiments, the method is a simultaneous multiplexed assay. Multiplexed measurement of analytes on a surface are described herein; see also, e.g., U.S. Patent Nos. 10,201,812; 7,842,246 and 6,977,722, incorporated by reference herein in their entireties.

[00386] In a specific embodiment, the methods of the invention can be used in a multiplexed format by binding a plurality of different analytes to a plurality of capture reagents for those analytes, the capture analytes being immobilized on coded bead, such that the coding identifies the

capture reagent (and analyte target) for a specific bead. The method may further comprise counting the number of beads that have a bound analyte (using the detection approaches described herein).

[00387] Alternatively or additionally, the capture reagents can be bound, directly or indirectly, to different discrete binding domains on one or more solid phases, e.g., as in a binding array wherein the binding domains are individual array elements, or in a set of beads wherein the binding domains are the individual beads, such that discrete assay signals are generated on and measured from each binding domain. If capture reagents for different analytes are immobilized in different binding domains, the different analytes bound to those domains can be measured independently. In one example of such an embodiment, the binding domains are prepared by immobilizing, on one or more surfaces, discrete domains of capture reagents that bind analytes of interest. Optionally, the surface(s) may define, in part, one or more boundaries of a container (e.g., a flow cell, well, cuvette, etc.) which holds the sample or through which the sample is passed. In a preferred embodiment, individual binding domains are formed on electrodes for use in electrochemical or electrochemiluminescence assays. Multiplexed measurement of analytes on a surface comprising a plurality of binding domains using electrochemiluminescence has been used in the Meso Scale Diagnostics, LLC, MULTI-ARRAY® and SECTOR® Imager line of products (see, e.g., U.S. Patent Nos. 10,201,812; 7,842,246 and 6,977,722, incorporated herein by reference in their entireties).

[00388] Still further, the capture reagents can be bound, directly or indirectly, to an electrode surface, which optionally includes different discrete binding domains, as described above. The electrode surface can be a component of a multi-well plate and/or a flow cell. Electrodes can comprise a conductive material, e.g., a metal such as gold, silver, platinum, nickel, steel, iridium, copper, aluminum, a conductive alloy, or the like. They may also include oxide coated metals, e.g., aluminum oxide coated aluminum. The electrode can include working and counter electrodes which can be made of the same or different materials, e.g., a metal counter electrode and carbon working electrode. In one specific embodiment, electrodes comprise carbon-based materials such as carbon, carbon black, graphitic carbon, carbon nanotubes, carbon fibrils, graphite, graphene, carbon fibers and mixtures thereof. In one embodiment, the electrodes comprise elemental carbon, e.g., graphitic, carbon black, carbon nanotubes, etc. Advantageously, they may include conducting carbon-polymer composites, conducting particles dispersed in a matrix (e.g. carbon inks, carbon pastes, metal inks, graphene inks), and/or conducting polymers. One specific embodiment of the

invention is an assay module, preferably a multi-well plate, having electrodes (e.g., working and/or counter electrodes) that comprise carbon, e.g., carbon layers, and/or screen-printed layers of carbon inks.

[00389] In embodiments, each binding domain comprises a targeting reagent complement capable of binding to a targeting reagent complement and each anchoring reagent and capture reagent comprise a supplemental linking reagent capable of binding to a linking reagent, and the method further comprises immobilizing a capture reagent and anchoring agent in each binding domain by: (1) binding the capture and anchoring reagent through the supplemental linking reagent to a targeting reagent complement connected to the linking reagent; and (2) binding the product of step (1) to the binding domain comprising the targeting reagent complement, wherein (i) each binding domain comprises a different targeting reagent complement, and (ii) each targeting reagent complement selectively binds to one of the targeting reagents.

[00390] Accordingly, in embodiments, the surface comprises the targeting reagent complement; the targeting reagent is connected to the linking reagent; and each of the capture reagent and anchoring reagent comprises the supplemental linking reagent. Thus, in embodiments, the targeting reagent complement on the surface binds to the targeting reagent, which is connected to the linking reagent, which binds to the supplemental linking reagent on the capture reagent and the anchoring reagent.

[00391] In embodiments, the linking reagent has more than one binding site for supplemental linking reagents, and the immobilization of the capture reagent and anchoring reagent further comprises: binding the capture and anchoring reagent through the supplemental linking reagent to a targeting reagent connected to the linking reagent; and binding the product of to the binding domain comprising the targeting reagent complement, wherein, (i) each binding domain comprises a different targeting reagent complement, and (ii) each targeting reagent complement selectively binds to one of the targeting reagents. For example, in the case where the targeting agent is an oligonucleotide, the linking reagent is streptavidin and the supplemental linking agent is biotin, a biotin-labeled oligonucleotide can be bound to a first of the four biotin binding sites of a streptavidin to form the targeting reagent connected to a linking reagent. A biotin-labeled capture reagent (i.e., a capture reagent linked to the supplemental linking agent) can then bind to a remaining biotin binding site on the streptavidin to connect the targeting agent to the capture reagent.

[00392] Exemplary targeting reagents and targeting reagent complements are described herein. In embodiments, the targeting reagent and targeting reagent complement are two members of a binding partner pair selected from avidin-biotin, streptavidin-biotin, antibody-hapten, antibody-antigen, antibody-epitope tag, nucleic acid-complementary nucleic acid, aptamer-aptamer target, and receptor-ligand. In embodiments, the targeting reagent is biotin and the targeting reagent complement is streptavidin. In embodiments, the linking reagent and supplemental linking reagent pair is a different binding partner pair than the targeting reagent and targeting reagent complement pair. In embodiments, the linking reagent is avidin or streptavidin, and the supplemental linking reagent is biotin. In embodiments, the targeting reagent and targeting reagent complement are complementary oligonucleotides.

[00393] In embodiments, the methods of the invention are applied to singleplex or multiplex formats where multiple assay measurements are performed on a single sample. Multiplex measurements that can be used with the invention include, but are not limited to, multiplex measurements i) that involve the use of multiple sensors; ii) that use discrete assay domains on a surface (e.g., an array) that are distinguishable based on location on the surface; iii) that involve the use of reagents coated on particles that are distinguishable based on a particle property such as size, shape, color, etc.; iv) that produce assay signals that are distinguishable based on optical properties (e.g., absorbance or emission spectrum) or v) that are based on temporal properties of assay signal (e.g., time, frequency or phase of a signal). Exemplary assay formats include V-PLEX (www.mesoscale.com/en/products_and_services/assay_kits/v-plex) and U-PLEX (www.mesoscale.com/en/products_and_services/assay_kits/u-plex_gateway, and U.S. Patent Nos. 10,201,812 and 10,189,023, each of which is incorporated herein by reference in its entirety). Additional ultrasensitive assay formats include those disclosed in U.S. Appl. No. 17/434,938, filed August 30, 2021, and U.S. Appl. No. 62/866,512, filed June 25, 2019, each of which is incorporated herein by reference in its entirety.

[00394] Exemplary plate readers include the MESO SECTOR S 600 (www.mesoscale.com/en/products_and_services/instrumentation/sector_s_600) and the MESO QUICKPLEX SQ 120 (www.mesoscale.com/en/products_and_services/instrumentation/quickplex_sq_120), both available from Meso Scale Diagnostics, LLC., and the plate readers described in U.S. Patent No. 6,977,722 and U.S. Patent Appl. No. 16/929,757, Titled: "Assay Apparatuses, Methods and

Reagents” by Krivoy et al., filed July 15, 2020, each of which is incorporated by reference herein in its entirety.

[00395] The user interface methodology described above may also be incorporated into a user interface of an assay system. The assay system that is described below allows a user to perform assays via the user interface. The following describes an example of a user interface incorporated into the assay system for assay method. The term “system software” or “system” referred to below in describing the functions of the assay system and its user interface refer to software that implements the assay system. The user interface is able to display or visualize a path of a workflow and/or menu items.

[00396] The following terminologies are used in describing the assay system and its user interface workflow.

[00397] Advanced Context Menu - A menu of options dependent on the particular context (such as current screen, sub-step, and the state of the screen) for advanced users.

[00398] Assay Method - The method by which an assay is performed, including but not limited to: 1. Instrument protocol that should be executed and the parameters for execution of that protocol; 2. Test plate layouts; 3. Calibrator titration scheme such as dilution factors; 4. Control layout; and 5. Sample replicate schemes.

[00399] Audit Log - A continuous record of events both automated and user-initiated that happened in the system that may impact the results generated. This record is used to trace issues and to ensure proper operations in controlled environments. The Audit Log is persistent and immutable. It includes a subset of the information in the Instrument Log.

[00400] Compatible Protocols - Protocols are compatible if they have the same basic outline and steps, although dilution ratios, times of incubation, washing, and others, may vary between them. Protocols are considered compatible if they can run on an automated platform together during the same run.

[00401] Completed Run - A run that has been aborted, completed with flag(s), or completed successfully.

[00402] CV - Coefficient of Variation.

[00403] Database Clean - Resets the entire database, restoring it to the state it was in at system installation.

[00404] ECL - Electrochemiluminescence. A proprietary format for detecting molecules of biological interest.

[00405] Existing Run - A run that has been planned, aborted, completed with flag(s), or completed successfully.

[00406] Global Product Data (GPD) - Data that is for a specific item identified with a GPI. While the same data can be used for multiple items, the GPI allows for matching of data to one specific item. The GPD may comprise information used to identify at least one element including (i) an assay consumable, (ii) one or more test sites within the consumable, (iii) a reagent and/or sample that has been or will be used in the consumable, or (iv) combinations thereof. Further, the GPD can be used to distinguish a first test site within the consumable from a different test site within the consumable. The GPD can comprise lot identification information, lot specific analysis parameters, manufacturing process information, raw materials information, expiration date, calibration data, threshold information, the location of individual assay reagents and/or samples within one or more test sites of the assay consumable, Material Safety Data Sheet (MSDS) information, or combinations thereof, The GPD can also comprise one or more analytical tools that can be applied by the system to analyze data generated during and/or after the conduct of an assay, assay system maintenance information, system-consumable promotional information, system and/or consumable technical support information, or combinations thereof. In addition, GPD includes consumable identification and/or configuration information, and one or more steps of an assay protocol that can be applied by the system in the conduct of an assay using the consumable.

[00407] Test sites may also be referred to as spots. Spot layouts may refer to arrays of test sites, for example, within a single well of a test plate or assay plate.

[00408] Global Product Identifier (GPI) - A system/instrument/consumable vendor-specified, unique identifier for an individual specific product such as an assay consumable. The identifier can be any number of configurations. In the case of consumables such as assay plates, the identifier may be an associated manufacturing barcode.

[00409] Types of GPI and GPD are known, e.g., see U.S. Patent No. 8,770,471, International Patent Appl. Pub. No. WO 2011/017082, and U.S. Patent Appl. Pub. No. 2006/199196.

[00410]

- [00411] Instrument Log - A detailed log file that records all actions carried out by the system and any failures or error states that have occurred during a run. The Instrument Log is a rolling circular log with stored information, limited by the amount of memory space allocated to this log file; for instance, older entries are overwritten over time.
- [00412] Instrument Software - Software that controls the instrument hardware
- [00413] LED - Light-emitting diode. A light source.
- [00414] Normal State - Instrument is considered to be in a normal state if the software is functioning without any error or warning. Instrument is returned to normal state once error state is recovered and/or warning message is acknowledged.
- [00415] Run - A run includes 0 or more named samples and 1 or more assay methods and tests the samples according to the information described in the assay methods.
- [00416] Run Owner - User who created the run.
- [00417] Sample - A generic term encompassing materials to be analyzed including Calibrators, Controls, Blanks, and Unknowns.
- [00418] Sample ID - The unique identifier for each sample.
- [00419] Sample Layout - The sample locations and sample IDs on a plate.
- [00420] Sample Type - The functional type of a sample such as Calibrator, Control, Blank, or Unknown.
- [00421] Spot Layout - The analyte locations and names in a well on a plate.
- [00422] Step - One of a sequence of separate, consecutive stages in the progression towards a goal. Steps constitute broad stages that may consist of multiple sub-steps.
- [00423] Sub-step - One of a sequence of separate, consecutive stages in the progression towards completion of a step. Sub-steps constitute focused activities within a step.
- [00424] Unexpected Barcode - A barcode that is different than the one expected. A consumable may also be considered to have an “unexpected barcode” if no barcode is read.
- [00425] User Interface (UI) - The software interface that the user of the instrument interacts with to control and monitor the system.
- [00426] UI Warning Event - Any attention messages that require a user response. The user should fix the error and/or acknowledge the message before proceeding. For example, a UI Warning Event may be that the instrument is in a “Not Ready” state.

[00427] System Events Log - A persisted log of events that occurred in the software that are not instrument related.

[00428] FIG. 4 is a flow diagram illustrating a first user login user interface for an assay system in one embodiment. 402, system software for assay method may check that the End User License Agreement (EULA) associated with the assay system has been accepted every time it starts. When the user first starts the system software, the EULA is presented. A record of the username and date and time is created when the user accepts the agreement. If the user has not previously accepted the agreement, at 404, EULA is displayed and allows the user to accept the agreement. At 406, if the user does not accept the agreement, the software closes. At 408, a splash screen is displayed that contains: System software branding, Copyright, Legal notice, Software Version. The initial login screen requests the username at 410. In one embodiment, the system software may present the past usernames used to login on the system to minimize error due to typing the username. The user is allowed to also enter a new username that has not previously been used to login. After selecting (or receiving) the username at 412 the software prompts the user to enter the password for the username at 414. In one embodiment, the system software may also use biometric ways such as facial recognition, voice, and/or fingerprint, to login or to verify login. In another embodiment, the system software may use a badge keycard that contains information that can be scanned or read via near field communication. At 416, the system software receives entered password. Once the username and password have been entered, the system software authenticates the user at 418. If the user is authenticated successfully, the user interface proceeds to a start screen at 420. Otherwise, the system software via the user interface prompts the user to retry. The system software in one embodiment next requires all users to login to access the software. In one embodiment, authentication may be performed through the Microsoft Windows® authentication facility and may be configured to authenticate through Active Directory. In this first user interface display, the username and password prompt may be displayed in one orientation, for example, horizontally on a horizontal wheel graphical element 422.

[00429] FIG. 5 is a flow diagram illustrating a method of displaying a start user interface screen display in one embodiment. This display screen includes lists of menu items in two different visual orientations, for example, horizontal and vertical. Thus, for example, a more general category of menu items is displayed on a horizontal wheel 502 and the submenu items are displayed on a vertical wheel 504. For instance, the START option 506, which has been selected from the login

user (FIG. 4) is presented on the horizontal wheel 502. The second level of options stemming from the START option 406 is presented on the vertical wheel 504. In this example assay method, the start screen is the initial software screen displayed to the user. The workflows that a user can perform are listed as options (sub options) on a vertical wheel they can selected from. In this assay method example, less common and advanced workflows may be grouped under an advanced menu. In this example assay method, the options for the workflows for the system include: Create a new run 508, when the user selects the create new run workflow 510 the user can create a run from scratch or base it on a previously defined run 512; Continue a run that was previously planned or started 514, when the user selects to continue a previously planned or started run 516, the software automatically resumes 518 from the last step the user completed in the run; View the results of a completed run 520, when the user selects to view a completed run 522, the software brings the user to the review screen 524. After the user selects any of the options from the vertical wheel 504, the options on the vertical wheel are added to a new horizontal wheel above the screen. This horizontal wheel allows the user to change their selection. For example, after selecting “Create New” the options for Planned and Completed runs are moved to the horizontal wheel allowing the user to change their mind.

[00430] FIG. 6 is a diagram illustrating a workflow of a define assay method screen in one embodiment. In this example, the software requires an Assay Method in order to process the samples being considered. The processing shown in this screen may be performed responsive to the DEFINE option (FIG. 5, 512) being executed. The assay method defines: The assays on the plate; The plate layout; Number of calibrators, controls, and max number of samples; Control, Calibrator, and sample dilutions; Number of replicates for controls, calibrators, and samples; The instrument protocol (incubation time, perform blocker, and/or others). A default Assay Method is provided for every kit, the system software allows the user to create a custom Assay Method based on a default. In one embodiment, the Assay Method is distributed in the Global Product Data (GPD) file. The GPD contains, for example: Product barcode; Assays; Placement of assays in the well; Lot identification for Kit, Plate, Antibodies, Calibrators, Controls; Measured concentration of: Calibrators, Controls; Instrument instructions on how to process the product; and Recommended plate layout.

[00431] FIG. 7 is a diagram illustrating a user interface workflow for selecting assay method in one embodiment. This user interface workflow may follow a selection or execution of defining

assay method, for instance, selected or executed as an option in the workflow shown in FIG. 6. Options under Define Assay Method may include Assay Method selection option, Samples option and Confirm option, which are shown in horizontal orientation, for example, on a horizontal wheel graphical element 702. The selected Assay Method option may be highlighted and/or centered on that horizontal wheel over other unselected options. The sub-level options below the Assay Method option may be displayed in vertical orientation, for example, on a vertical wheel graphical element 704. In this example, there may be 3 ways the user can select an Assay Method: a) Selecting from recent Assay Methods used on the system sorted by reverse chronological order; and b) Selecting from all available Assay Methods installed on the system. In this screen the UI uses multiple wheels, and each wheel filters the results of the following wheel until the final wheel contains just the results: c) Searching for an Assay Method installed on the system, which can be done using free text search.

[00432] When the user selects one of the sub-level options, the sub-level options move into the horizontal wheel to allow the user to change their Assay Method selection model. After the user makes the initial selection of the assay method, the user is allowed to select whether the user only wants to run a single assay method or multiple assay methods: Single assay method, wherein all Mesoscale Diagnostics test plates in the run use the same assay method; Multiple assay method, wherein there are at least one Mesoscale Diagnostics test plate per assay method in the run.

[00433] FIG. 8 is a flow diagram illustrating a workflow of a user interface displayed for defining samples in one embodiment. Based on selecting “Define Samples” option, that option is shown in horizontal orientation, for example, on a horizontal wheel graphical element 802, which may be stacked under the Define option, its parent menu item. The sub-level of options associated with the “Define Samples” options are displayed vertically, for example, on a vertical wheel graphical element 804.

[00434] In the Define samples screen the user interface allows the user to select to import samples or manually define the samples. These options move to the horizontal wheel after the user selects an option. When the user selects to import samples from a file, the software via the user interface presents the sample files the user can use in a vertical wheel. The system can alternatively import from a Laboratory Information System or a Laboratory Information Management System.

[00435] The system can also import from a sample management system. When the user selects to manually define samples, the user may define the number of samples to run. The software automatically assigns samples IDs.

[00436] FIG. 9 is a flow diagram illustrating a workflow of a user interface displayed for confirming a run definition in one embodiment. Based on selecting “Confirm Run Definition” option, a submenu item of “Define” option, the “Confirm Run Definition” option is displayed on a horizontal wheel graphical element, for example, stacked below its parent menu item, “Define” option. After the user has defined the run in the previous steps, the system provides a summary of the run for the user to review and confirm. The following information is displayed to the user: The number of samples in the run. The user may also select the number of samples to view the sample identifiers (IDs), the number of Mesoscale Diagnostics plates in the run, the layout of the plates, and the name of the run. The system gives a default name to the run and allows the user to change it. Once the user has confirmed the run, the system prompts the user requesting whether the user wants to continue to execute the run or return to the Start Goal.

[00437] FIG. 10 is a flow diagram illustrating a workflow of a user interface displayed for notifying the user of the accomplished tasks in one embodiment. The system may walk the user through accomplishing tasks via the user interface in a wizard (an automated help feature). The major logical steps may be broken down into Goals. In this example, the system has three major goals in the wizard: Start, wherein the user begins and selects what the user wants to do in the system; Define, wherein after the user picks what the user wants to do, the wizard walks the user via the user interface through defining any information needed; and Execute, wherein the system walks the user through execution of the task the user has selected.

[00438] FIG. 11 is a flow diagram illustrating a workflow of a user interface displayed for execute/collect option in one embodiment. In this collect screen the system creates a list of items that the user needs to collect in order to perform the run. Each item has to be marked as collected before proceeding. The system also allows the user to print this list or use a tablet computer for collection. For each item to be collected the item may optionally be scanned so the system can check it is the correct item, expiration date, lot information. For instance, the system may request bar code scans on items. This is done using the barcode (GPI) to retrieve the GPD.

[00439] FIG. 12 is a flow diagram illustrating a workflow of a user interface displayed for execute/prepare option in one embodiment. In this prepare screen, the system presents a list of

steps needed to prepare items that were collected in a wheel. For each step in the wheel the system presents the detailed instructions for that prepare step when it is selected. The detailed prepare step may include: Text that describes the actions to be taken; Images that visually indicate the actions; Video that demonstrates the actions; and Web content, as in Web pages, which provide further details or context about the actions. The user is prompted to indicate that all the prepare steps have been completed before proceeding to the next step. The user may also print the prepare steps or complete them using the tablet.

[00440] FIG. 13 is a flow diagram illustrating a workflow of a user interface displayed for execute/load option in one embodiment. In this load screen the system displays a list of the items to load onto the instrument in a wheel format. For each item the system displays graphically where the item should be loaded. The system provides a graphical indication of whether the item was loaded or is empty. The system checks whether all the items have been loaded before proceeding to the next screen.

[00441] FIG. 14 is a flow diagram illustrating a workflow of a user interface displayed for execute/run option in one embodiment. This run screen allows the user to indicate to the system to start the run, for example, via a run button UI control. This screen also allows the user to register other users for system update messages. The updates may be distributed through for example, electronic mail (email), text such as short message service (SMS), social network applications and/or blogs, and/or others. Once the user initiates the run, the system transitions to present a timer of the estimated time to completion. In one embodiment, there are 3 modes to the timer; 1) Estimated time in an analog watch format; 2) Estimated time in a digital watch format; and 3) A live camera feed of the instrument. The user may also request the run to stop through the advanced context menu.

[00442] FIG. 15 is a flow diagram illustrating a workflow of a user interface displayed for execute/unload option in one embodiment. After a run completes, the system transitions to this unload screen. At the unload screen a list of steps is presented to unload the system in a wheel. For each item the system displays graphically where the item should be unloaded. The system provides a graphical indication of whether the item is loaded or is unloaded. The user needs to unload all the items before proceeding to the next screen.

[00443] FIG. 16 is a flow diagram illustrating a workflow of a user interface displayed for execute/review option in one embodiment. At the review screen, the system presents the results

of the run. The results are also automatically exported in: File format; Transmitted to LIMS/LIS system; and Email. The results are presented and can be viewed: a) Graphically as a plate representation. ECL or Calculated Concentration is displayed using a luminosity scale, where a dark/black color indicates a low result and a bright color indicates a high result. A scale is presented to annotate the color luminosity to number; b) The results are also available as a table. This table can be exported through File format; Transmitted to LIMS/LIS system; and/or Email. The system records any unusual operations or results in a table, for instance, if the temperature during the run was not in the specified range. After the user is done reviewing the run data, the user may go to the Start goal to begin another run or view results.

[00444] FIG. 17 is a flow diagram illustrating a workflow of a user interface displayed for execute/review option in one embodiment. In one embodiment, the system categorizes tasks the user may do into major workflows and advanced workflows. Major workflows are those the user will routinely perform and are optimized for ease of execution. The major workflows are represented in the wizard Goals and steps. Advanced workflows are present in the advance context menu and represent workflows that are not routinely done or restricted to configuration manager. The user opens the advanced context menu by clicking on the Mesoscale Diagnostics Globe. The advanced context menu items are contained in a vertical wheel with 3 main groups: Functions related to the current screen – context sensitive items, which change depending on the active screen; Modules that can be switched to; and Functions that are applicable across all modules, for instance login and logout of the software. In this screen, the selected option, advanced menu is displayed horizontally on a horizontal graphical wheel, while the sub-options of the advanced menu are shown vertically on a vertical graphical wheel.

[00445] In one embodiment, the graphical user interface in one embodiment maximizes black space by making the background black, thereby minimizing coloring of pixels in the user interface display (e.g., display screen), save storage and improve speed of presentation. FIG. 20 is an example screen shot of a screen displaying graphical wheel/slider, which maximizes screen black space, in one embodiment.

[00446] Further screen shot examples consistent with embodiments hereof are shown in FIGS. 58-63. FIGS. 58A-58HH are example non-limiting embodiments of the reader module. FIGS. 59A-59T are example non-limiting embodiments of an experiment module. FIGS. 60A-60I are example non-limiting embodiments of a maintenance module. FIGS. 61A-61Q are example non-

limiting embodiments of an admin console module. FIGS. 62A-P are example non-limiting embodiments of generic screenshot applicable to multiple modules herein. FIG. 63 is an example non-limiting embodiment of an audit trail module. FIGS. 64A-64RR are examples of non-limiting embodiments of an assay method module.

[00447] Further screen shot examples consistent with embodiments hereof are included in U.S. Design Patent Application No. 29/675,777, Titled “Display Screen with Graphical User Interface,” and filed on January 4, 2019, which is incorporated by reference herein in its entirety.

[00448] As described above, the user interface in the present disclosure, whether used in an assay system or another system, is capable of presenting the complete trail on a single screen of a user interface display, for example, on a graphical wheel, and allowing the user to select any item on any level to go back from the current path of selected items, for example, instead of having to enter or type a series of back buttons on a keyboard or another input device. The user interface allows for past decisions to be visible, for example, primary decision and last n recent decisions (the history of decision may be visible via scrolling through the graphical wheel or another graphical element such as a graphical slider).

[00449] In one embodiment, the graphical user interface minimizes the number of menu choices the user needs to make in order to navigate through the assay system. For instance, the order in which the menu choices are presented may minimize the number of user options.

[00450] In one embodiment, by minimizing options or choices to present to the user and receive input from those choices, computer processing time may be improved. The user interface leads the user through the next step in the application, while providing minimal number of choices the user needs to make.

[00451] In other embodiments, the certain features described herein can be used to divide one or more problems into different segments for multiple users to solve (e.g., sequentially or in parallel) collaboratively. In this regard, a processor can be adapted to receive one or more benchmark inputs (e.g., inputs that provide information that provide support for, or a solution to, a larger problem, experiment, assay, or the like. The benchmark inputs can be aggregated, which can be relied on collectively to collaboratively solve the problem, carry out the experiment, etc. Such inputs can be based on one or more of the following: (a) a module; (b) a problem or sub-problem to be solved; (c) a device; (d) a physical location; (e) a tool; (f) an instrument; or (g) equipment. Further, a processor can be adapted to notify or the more users, accounts, or teams, of

the results derived from one or more of received benchmark inputs. In one example, (e.g., performing an assay), this can include a notification to a researcher responsible for carrying out an experiment that a first user completed the design of an assay experiment (thus notifying the researcher that the experiment is ready to be performed), and another notification back to the first user that the researcher completed carrying out the experiment after the experiment is complete (e.g., so that the first user can review the results of the experiment). Moreover, the processor can be adapted to supply an output in response to a received response, such that the output can be adapted to be transmitted to a device communicatively connected to the processor (i.e., interfaced with components, devices, etc. of the physical world) for directing the device to perform certain actions (e.g., a physical movement or undergo a physical transformation). In certain embodiments, the processor causes a response to these components in the physical world as a step within the broader process of dividing one or more problems into different segments for multiple users to solve as described above. Additionally, certain aspects of these (and other processes described throughout) can be controlled by the processor through a permissions command. The permissions command can be used to manage one or more of user's and team's levels of access, security, or control. Those permissions can be based on various levels, including one or more of a role, user, team, account, instrument, equipment, or device. In this regard, a sophisticated set of permissions can be created to establish multiple levels of security for multiple applications so that access, control, and security can be tightly maintained and controlled in a highly versatile fashion.

[00452] The following discussion provides additional embodiments and implementations of the system as presented herein. The user interface systems discussed above may be broadly applicable to a variety of applications, including manufacturing environments, testing environments, instrumentation environments, experimental environments, and others. In a series of embodiments, the user interface systems discussed above may be employed to provide a user interface into a comprehensive bioinstrumentation system encompassing software, hardware, testing equipment, and all additional required features. The following discusses such a comprehensive bioinstrumentation system. In particular, the following discusses an embodiment of the systems described herein as a cloud-based platform. The embodiments discussed below, e.g., with respect to FIGS. 21-50 may also be implemented via alternative networked hardware and software platforms.

[00453] The description herein is made with reference to the figures for purposes of convenience only; it is not restrictive as to the scope of embodiments hereof. The ensuing description is adaptable to a variety of analytical applications, including without limitation, bioanalytical applications, chemical analytical applications, radiological analytical applications, and the like.

[00454] The components shown may include computer-implemented components, for instance, implemented and/or run on one or more hardware processors, or coupled with one or more hardware processors. One or more hardware processors, for example, may include components such as programmable logic devices, microcontrollers, memory devices, and/or other hardware components, which may be configured to perform respective tasks described in the present disclosure. Processors and cloud-based processing systems as disclosed in FIGS. 21-50 may be examples of processor 1110. Coupled memory devices may be configured to selectively store instructions executable by one or more hardware processors. Memory devices and cloud-based storage systems as disclosed in FIGS. 21-50 may be examples of storage device 1120. Examples of a processor may include, but are not limited to, a central processing unit (CPU), a graphics processing unit (GPU), a field programmable gate array (FPGA), an application specific integrated circuit (ASIC), a cloud based processing unit, another suitable processing component or device, or one or more combinations thereof.

[00455] FIG. 21 is an embodiment of a cloud-based system providing seamless integration of other systems, computers, and instruments, e.g. bioinstruments, supporting and optimizing users doing analytical work, e.g., bioanalytical work. 21100 is the system boundary around the other systems, computers, and instruments either wholly or partly makes up the analytical computing system 21100, wherein, the operating system on each computer and/or instrument, in whole or part, includes the analytical computing system 21100 can include, e.g., Windows™, UNIX, Linux, MacOS™, iOS™, Android™, and/or any other commercial, open-source, and/or special-purpose operating system. At 21101 is an analytical user environment including one or more servers, desktop computers, laptop computers, tablet, and/or mobile devices of which one or more of same can be used in system 21100. One or more analytical user environments 21101 can use the analytical system 21100. At 21102 is a support provider environment including one or more servers, desktop computers, laptop computers, tablet, and/or mobile devices of which one or more of same can be used in system 21100 supporting instruments, consumables, and/or software used

by analytical users in analytical user environment 21101. There can be one or more support provider environments at 21102 using the analytical computing system 21100. At 21103 is a consumable provider environment including one or more servers, desktop computers, laptop computers, tablet, and/or mobile devices of which one or more of same can be used in analytical computing system 21100 for providing consumables to be used by users in analytical user environment 2001, optionally in conjunction with instrumentation including instrumentation environment 21106. There can be one or more consumable provider environments at 103 using the analytical computing system 21100.

[00456] At 21105 is an analytical instrumentation provider environment for a provider of instrumentation that can be used in instrumentation environment 21106 and that includes one or more servers, desktop computers, laptop computers, tablet, and/or mobile devices of which one or more of same can be used in analytical computing system 21100 for providing, e.g., selling or otherwise transferring instruments to be used by users in analytical user environment 21101. There can be one or more instrumentation provider environments at 21105 using the analytical computing system 21100. At 21104 is an analytical computing system provider environment for the provider of analytical computing system 21100, which includes one or more servers, desktop computers, laptop computers, tablet, and/or mobile devices of which one or more same can be used in system 211000 to manage the business interaction with analytical computing system 21100 to be used by analytical users in analytical user environment 2001. Each of the “providers” associated with the environments at 21102, 21103, 21104, and 21105 can include one or more entities, including without limitation, a multiplicity of independent businesses, a single independent business, a combination of different independent businesses, or one or more businesses within any one of the “providers” herein. At 21106 is an instrumentation environment including one or more instruments, each with at least one computer that in one practice can be at least partially used by analytical computing system 21100 to run tests on samples for users in an analytical user environment 21101. At 21107 is a cloud platform leveraged to connect, e.g., bi-directionally connect, through computers, networking, and software some or all of the computers in analytical computing system 21100 having in one practice, a common computing, software services, and data architecture such that data can be collected and shared by any computer having associated software of the analytical computing system 21100, wherever a particular computer with associated software in analytical computing system 21100 is located throughout the world, in a secure

manner, wherein cloud platform 21107, in the preferred embodiment, is hosted by a public-cloud provider providing a shared computing environment, for example, Amazon™ Web Services, Google™ Cloud, Microsoft™ Azure, or others. In other embodiments, the cloud platform 21107 can be hosted by the analytical computing system provider at 21104; or it can be self-hosted by an analytical user environment being a user of the analytical computing system 21100; or it can be hosted by a private-cloud provider providing a dedicated computing environment, for example, Oracle™ Cloud, IBM™ Cloud, Rackspace, or others; or it can be hosted on some combination of public-cloud, private-cloud, self-hosted, and hosted by the analytical computing system provider 21104. All communication with cloud platform 21107 can be done through the preferred embodiment over a secure communication protocol, such as without limitation https, to encrypt all communication between sender and receiver; but an unsecure communication protocol, such as without limitation Hypertext Transfer Protocol Secure (HTTPS), can be used as well using optionally in either the secured or unsecured case connected technologies, such as Ethernet for local area network (LAN), metropolitan area network (MAN), and/or wide area network (WAN) configurations, and/or unconnected technologies, such as WIFI, Bluetooth, and/or other like technologies for a distributed LAN. Additionally, analytical computing system 21100 can be wholly deployed on one computer such that all operations of analytical computing system 21100 occur on that computer with the only external communication occurring between computers and associated software running outside of analytical computing system 21100.

[00457] FIG. 22 is an embodiment of a cloud-based system as shown in FIG. 21 that provides seamless integration of other systems, computers, and instruments supporting and optimizing users doing analytical work. 21100 depicts the boundary of the analytical computing system that encompasses other systems, computers, and instruments that include either wholly or partly the system bounded by 21100. At 21101 is an analytical user environment including one or more servers, desktop computers, laptop computers, tablets, and/or mobile devices of which one or more of same can be used in analytical computing system 21100. Administrator computer(s) 22202 includes one or more computers with software used by system administrators to manage the use of system 21100 by users in analytical user environment 21101 through services and data storage/retrieval provided by the cloud platform 22223. Analytical user computers 22203 includes one or more computers with software used to perform analytical tasks by users in an analytical user environment at 21101 through services and data storage/retrieval provided by the cloud

platform 22223. Data integration computers 22204 includes one or more computers with software used to integrate, e.g., bi-directionally integrate, other business systems 22224 in analytical user environment 21101 with the analytical computing system 21100 providing services for the analytical user business systems 22224 through services and data storage/retrieval provided by cloud platform 22223. Analytical user business system 22224 can be hosted internally, externally, and/or some combination of internally and externally to analytical user environment 21101 and can include one or more computer systems optionally with software, examples being laboratory information systems (LIMS), data analysis applications, data visualization applications, data reporting applications, business productivity applications, relational and/or non-relational databases, file servers, and/or any other systems providing access to the data of the analytical computing system 21100 to users directly using the analytical computing system 21100, to users not directly using the analytical computing system 21100, and/or to one or more other computer systems included with the business system 22224 not directly interfacing with the analytical computing system 21100.

[00458] Support provider environment 21102 is a support provider for users of analytical computing system 21100, users of consumables from a consumable provider, and/or instrumentation in instrumentation environment 21106 including one or more servers, desktop computers, laptop computers, tablets, and/or mobile devices of which one or more of same can be used in the analytical computing system 21100 supporting instruments, consumables, and/or software used by analytical users in the analytical user environment 21101.

[00459] Support user computer 22206 includes one or more computers with software provided to users associated with a support provider environment 21102 that, among other things, can monitor, manage, and/or report on activity on the analytical computing system 21100 through services and data storage/retrieval provided by the cloud platform 22223; and support data integration computer 22207 includes one or more computers with software and/or firmware used to integrate other support business systems 22208 in support provider environment 21102 with analytical computing system 21100 providing services for support business systems 22208 through services and data storage/retrieval provided by the cloud platform 22223. Support business systems 22208 can be hosted internally, externally, and/or by some combination of internally and externally to support provider environment 21102 and can include one or more computer systems optionally with software, examples being customer relationship management, enterprise data

systems, data analysis applications, data visualization applications, data reporting applications, business productivity applications, relational and/or non-relational databases, file servers, and/or any other systems providing access to the data of analytical computing system 21100 to users directly using the support user computer(s) 22206, to users not directly using the support user computer(s) 22206, and/or one or more other computer systems included with support business system 22208 not directly interfacing with the analytical computing system 21100.

[00460] Consumable provider environment 21103 is a consumable provider environment including one or more servers, desktop computers, laptop computers, tablets, and/or mobile devices of which one or more of same can be used in analytical computing system 21100 for a provider of consumables to users in analytical user environment 21101, which can be optionally used in conjunction with instrumentation in instrumentation environment 21106 for providing consumables to users in analytical user environment 21101 to optionally be used with instruments in instrumentation environment 21106. Consumable information upload computer 22210 includes one or more computers with software used to deliver consumable information regarding provided consumables from consumable provider business systems 22211 to analytical computing system 21100 through services and data storage provided by cloud platform 22223. Consumable information, as used herein, may include, but is not limited to, global product data (GPD). Consumable provider business system 22211 can be hosted internally, externally, and/or by some combination of internally and externally to consumable provider environment 21103 and can include one or more computer systems optionally with software, examples being customer relationship management, enterprise data systems, data reporting applications, business productivity applications, relational and/or non-relational databases, file servers, and/or any other systems supporting business operations for the consumable provider to support delivery of consumable information to the analytical computing system 21100 or which is not used at all in the delivery of consumable information to the analytical computing system 21100.

[00461] Analytical computing system provider environment 21104 is the analytical computing system provider environment for the provider of analytical computing system 21100 including of one or more servers, desktop computers, laptop computers, tablets, and/or mobile devices of which one or more of same can be used in the analytical computing system 21100 for providing analytical computing system 21100 to users in analytical user environment 21101 and instrumentation in instrumentation environment 21106, as well as for various providers at 21102, 21103, and 21105,

wherein, account information upload computer(s) 22213 includes one or more computers with software used to prepare and control the use of analytical computing system 21100 by users in analytical user environment 21101 and instrumentation in instrumentation environment 21106 through services and data storage provided by cloud platform 22223. Computing system provider business system 22214 can be hosted internally, externally, and/or some combination of internally and externally to analytical computing system provider environment 21104 and can include one or more computer systems optionally with software, examples being customer relationship management, enterprise data systems, data reporting applications, business productivity applications, relational and/or non-relational databases, file servers, and/or any other systems supporting business operations for the analytical computing system provider to support preparing and controlling the use of analytical computing system 21100, or not used at all in preparing and controlling the use of the analytical computing system 21100.

[00462] Instrumentation provider environment 21105 includes one or more servers, desktop computers, laptop computers, tablets, and/or mobile devices of which one or more of same can be used in analytical computing system 21100 for a provider of instrumentation to users in analytical user environment 21101 and which can optionally be used as instrumentation in instrumentation environment 21106 for processing samples under test and optionally with one or more consumables provided by consumables provider environment 21103. The instrument information upload computer(s) 22216 includes one or more computers with software used to deliver instrument information regarding provided instrumentation from an instrumentation provider business system 22217 to analytical computing system 21100 through services and data storage provided by the cloud platform 22223. Instrumentation provider business system 22217 can be hosted internally, externally, and/or by some combination of internally and externally to instrumentation provider environment 21105 and can include one or more computer systems optionally with software, examples being customer relationship management, enterprise data systems, data reporting applications, business productivity applications, relational and/or non-relational databases, file servers, and/or any other systems supporting business operations for the instrumentation provider to support delivery of instrument information to the analytical computing system 21100, or not used at all in the delivery of instrument information to the analytical computing system 21100.

[00463] Instrumentation environment 21106 including one or more instruments with each instrument being either an individual-operation instrument 22221, a coordinated-operation instrument 22222, or a workflow-aid instrument(s) 22226 provided by instrumentation provider environment 21105 which can be leveraged by users in analytical user environment 21101 to process samples optionally in conjunction with consumables provided by consumable provider environment 21103 to generate data for analysis by users in analytical user environment 21101, wherein, an individual-operation instrument 22221 can have an individual-operation instrument computer 22219 providing integration between the individual-operation instrument 22221 and the analytical computing system 21100 through services and data storage provided by the cloud platform 22223, as well as optionally providing operational control over the individual-operation instrument 22221; a coordinated-operation instrument 22222 can also have a coordinated-operation instrument computer 22220 that provides integration between the coordinated-operation instrument 22222 and the analytical computing system 21100 through services and data storage provided by the cloud platform 22223, as well as optionally providing operational control over the coordinated-operation instrument 22222; and workflow-aid instrument 22226 can have a workflow-aid instrument computer 22225 that provides integration between the workflow-aid instrument 22226 and the analytical computing system 21100 through services and data storage provided by the cloud platform 22223, as well as optionally providing operational control over workflow-aid instrument 224. Examples of an individual-operation instrument 22221 include without limitation a plate reader, plate washer, plate incubator, plate shaker, plate incubator-shaker, pipetting system, or any other type of instrument used in analytical sample testing. Coordinated-operation instrument 22222 can combine some or all of the functions provided by one or more of the individual-operation instruments 22221 into an integrated platform automating execution of the individual operations of individual-operation instruments 22221, thereby relieving a user from executing the various individual operations of individual-operation instruments 22221. Workflow-aid instrument 22226 can provide support to a user leveraging either individual-operation instrument(s) 22221 and/or coordinated-operation instruments 22222 to test assays on samples in the instrumentation environment 21106 where the support includes, but is not limited to, collecting various consumables stored at various temperatures potentially in different physical locations, preparing consumables to be used in the processing of one or more assays, and/or leading a user through the overall assay steps using one or more of the individual-

operation instruments 22221. In the alternative, the consumable provider environment analytical user app 21103 can assist with other tests in addition to or in place of the assay tests and/or plate-based tests described herein.

[00464] Instrumentation in instrumentation environment 21106 can include zero or more individual-operation instruments 22221 each with their corresponding individual-operation instrument computer 22219, zero or more coordinated-operation instruments 22222 each with their corresponding coordinated-operation instrument computers 22220, and/or zero or more workflow-aid instruments 22224 each with their corresponding workflow-aid instrument computers 22225. A preferred embodiment for instrumentation environment 21106 includes providing a separate computer integrating zero or more individual-operation instruments 22221, zero or more coordinated-operation instruments 22222, zero or more workflow-aid instruments 22224, zero or more individual-operation instrument computers 22219, zero or more coordinated-operation instrument computers 22220, and zero or more workflow-aid instrument computers 22225 to analytical computing system 21100 through services and data storage provided by cloud platform 22223.

[00465] In FIG. 23 is an embodiment of system architecture for cloud platform 22223 as part of the analytical computing system 21100 providing common computing, software services, and data architecture such that data are collected and shared by any computer anywhere in the world having associated software of the analytical computing system 21100 (FIG. 21), wherein, one or more services servers 23302 provide a scalable, robust, and high-performing computing and associated software platform to support services specific to the analytical computing system 21100 for retrieving, storing, transferring, and/or transforming data associated with the use of the analytical computing system 21100; one or more database servers 23309 (e.g., including one or more team databases 23310 and one or more system databases 23311) providing a scalable, robust, and high-performing computing and associated software platform for one or more structured databases used for storing and/or retrieving data produced by and/or for users of the analytical computing system 21100, as well as, for storing and/or retrieving data produced and/or used by the analytical computing system 21100 for its preparation for use as well as through its use, wherein, the database technology can be relational in nature as e.g. SQL Server, Oracle, MySQL, Postgres, Aurora, and/or other like relational database technologies; and/or can be non-relational in nature as e.g. Dynamo DB, Mongo DB, and/or other like non-relational database technologies;

with one or more bulk data servers 23315, which may include system content 23312, instrument content 23313 and consumable content 23314, providing a scalable, robust, and high-performing computing and associated software platform for storing and retrieving file-based data provided for use of the analytical computing system 21100 and/or produced through the use of the analytical computing system 21100. The services server(s) 23302 has associated with it, in one embodiment, a logical collection of services, namely: admin 23303 including a logical collection of services to support administration of the use of analytical computing system 21100; dashboard 23304 including a logical collection of services to support monitoring and control of the use of analytical computing system 21100; upload 23305 including a logical collection of services supporting upload of consumable and instrument information to analytical computing system 21100; system 23306 including a logical collection of services supporting various non-user-specific functions associated with overall use of analytical computing system 21100; application 23307 including a logical collection of services supporting typical scientific use of analytical computing system 21100 by analytical users; and authenticate 23308 including a logical collection of services supporting secure log-in to analytical computing system 21100 as well as log-out from analytical computing system 21100. In one practice, services server(s) 23302 is an easily scaled computing infrastructure from one or more servers as represented by services server(s) 23302 wherein, in a preferred embodiment, each server has deployed all logical collection of services 23303, 23304, 23305, 23306, 23307, and 23308 to enable a load balancer to equally distribute requests for services across the one or more servers represented by services server(s) 23302 to optimize user interaction. This load balancing technique can be effectuated, e.g., if the logical collection of services 23303, 23304, 23305, 23306, 23307, and 23308 are designed using a RESTful (representational state transfer) design pattern, i.e., each provided service is stateless, i.e., does not store or hold data, and therefore any request made on the service can be fulfilled by any available server on which the service deployed in services server(s) 23302 based on demand at the time of request. To support optimal deployment and operation of the logical collection of services 23303, 23304, 23305, 23306, 23307, and 23308 on one computer or on many computers, the preferred embodiment is for these services to be built on a distributed-object platform such as, e.g., Java Platform Enterprise Edition to be able to support cross-platform computing architectures, .NET Framework for Windows-only computing architectures, or other like distributed-object platform, or leveraging some combination of one or more of these distributed-object platforms. Database

Server 23310 can include one or more databases, for example, Team Database 23310 and System Database 23311. Team Database 23310 is adapted to store information, data, and/or metadata as it relates to Teams (e.g., Team name, members, permissions, etc.). System Database 23111 can include files, data, and/or other information as it relates system functionalities. Further, Bulk Data Server 23315 can include various content, e.g., System Content 23312, e.g., data or content relating to the system's functionality, etc., Instrument content 23313, e.g., type of instrument, parameters, etc., and Consumable Content 23314, e.g., type of consumable, quantities, etc.

[00466] In FIG. 24 is an embodiment of an administrator using an Administrator Computer 24401 to run administrator app software 24402 to perform administrative functions provided by the analytical computing system 21100 through services provided through the cloud platform 22223. The administrator app software, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the administrator computer 24401 and the cloud platform 22223. By way of example, one or more services servers 24411 can provide various functionalities such as authentication, one or more other administrative functionalities, capability for uploading data, e.g., to one or more database servers, one or more system functionalities, one or more applications, e.g., app functions, and/or graphical visualization support via a dashboard. The administrator app 24402 can be executed on the administrator computer 24401 through either a distinct application installed on the administrator computer 24401, or accessed via an internet browser installed on the administrator computer 24401 pointing to a Uniform Resource Locator (URL) with a web site part of the services provided by cloud platform 22223 logically organized with admin 24408 in this embodiment but not limited to that organization. In one embodiment, the first interaction between an administrator and the cloud platform occurs through use of administrator app 24402 requesting login services, e.g., via a user manager 1056 of methodical user interface control system 1102, through service link 24403 to authenticate, 24404, with appropriate credentials that, e.g., include a unique username and password and/or metric identification and can also include an optional or required additional authentication input, commonly referred to as two-factor authentication, previously configured for use by an administrator. In this embodiment, the login service retrieves a user's encrypted credentials, through a service link 24405, from system database 24406 to verify that the administrator can access and administer analytical computing system 21100 with the login

updating data stored in system database 24406 through the service link 24407 to track usage of analytical computing system 21100. An administrator can also reset their own password via administrator app 24402 through service link 24403 to authenticate 24404 if they forgot or do not know their password, with the password reset updating data stored in system database 24406 through service link 24407 to track usage of analytical computing system 21100. Administrators can also configure their additional authentication input via administrator app 24402 through service link 24403 to authenticate 24404 so as to retrieve and change the configuration of their additional authentication input through service link 24405 to system database 24406 with the configuration change updating data stored in system database 24406 through the service link 24407 to track usage of analytical computing system 21100. After an administrator is authenticated on login, they can use services provided by admin 24403 through use of administrator app 24402 through service link 24407 to perform administrative functions of the analytical computing system 21100, wherein, these services, as required, use the service link 24407 to create, read, update and/or delete data stored in system database 24406, e.g., via data storage manager 1064, with the use of these services also creating and updating data stored in system database 24406 through the service link 24407 to track usage of analytical computing system 21100. Additionally, an administrator in performing administrative functions for analytical computing system 21100, as provided by administrator app 24402, can create one or more new groups of users whose use of the analytical computing system 21100 is through a shared team database 24414 through a service link 24413 as well as create a new database server 24415 through a service link 24412 to which the new team database 24414 can be added so as to optimize performance of database server(s) 24415. Ultimately, an administrator can logout from use of analytical computing system 21100 via administrator app 24402 through service link 24403 to terminate their current use of analytical computing system 21100 with the logout service of authenticate 24404 updating the administrator's login information through a service link 24409 to the system database 24406 with the logout updating data stored in system database 24406 through service link 24407 to track usage of analytical computing system 21100. Analytical Computing System 21100 can include one or more Services Servers 24411. These servers are adapted to host various applications and/or modules including, system modules, application modules, authentication modules, administrative modules, dashboard modules, and upload modules. In one embodiment, the authentication and

administration modules allow users to communicate, e.g., through one or more service link, with System Database 24406 and/or the Team Database 24414 through the Administrator App 24402.

[00467] FIG. 25 is an embodiment of an analytical user using an analytical user computer 25502 to run an analytical user app software 25503 to perform analytical functions provided by an analytical computing system 21100 through services provided through a cloud platform at 22223. The analytical user app software 25503, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the analytical user computer 25502 and the cloud platform 22223. The analytical user app 25503 can be executed on analytical user computer 25502 through either a distinct application installed on the analytical user computer 25502 or accessed via an internet browser installed on the analytical user computer 25502 pointing to a URL with a web site part of the services provided by cloud platform 22223 logically organized with an application 25509 in this embodiment but not limited to that organization. In one practice, the first interaction for an analytical user with cloud platform 22223 is through use of an analytical user app 25503 requesting login services through a service link 25504 to authenticate, 25505, with appropriate credentials that can include a unique username and password and/or another information such as biometric identification and can also include an optional or required additional authentication input, commonly referred to as two-factor authentication, previously configured for use by an administrator, wherein, the login service can retrieve a user's encrypted credentials through a service link 25506 from a system database 25507 to verify that the analytical user may access and use analytical computing system 21100 with the login updating data stored in system database 25507 through the service link 25506 to track usage of analytical computing system 21100. An analytical user can also reset their password via analytical user app 25503 through service link 25504 to authenticate, 25505, if they forgot or do not know their password with the password reset updating data stored in system database 25507 through service link 25506 to track usage of analytical computing system 21100. An analytical user can also configure their additional authentication input via analytical user app 25503 through service link 25504 to authenticate, 25505, so as to retrieve and change the configuration of their additional authentication input through service link 25506 to system database 25507 with the configuration change updating data stored in system database 25507 through the service link 25506 to track usage of analytical computing system 21100. After an analytical user is authenticated on

login, they can use services provided by an application 25509 through use of the analytical user app 25503 through a service link 25508 to perform analytical functions provided by application 25509, wherein, these services, as required, use the service link 25510 to create, read, update, and/or delete data stored in team database 25511 with the use of these services also creating and updating data stored in system database 25507 through the service link 25510 to track usage of analytical computing system 21100. Ultimately, an analytical user can logout from use of the analytical computing system 21100 via analytical user app 25503 through service link 25504 to terminate their current use of analytical computing system 21100 with the logout service of authenticate 25505 updating the analytical user login information through service link 25506 to the system database 25507 with the logout updating data stored in system database 25507 through the service link 25506 to track usage of analytical computing system 21100.

[00468] In FIG. 26 is an embodiment of a data integration computer 26602 running data integration app software 26603 to perform data integration functions provided by an analytical computing system 21100 through services provided through a cloud platform at 22223 between the analytical computing system 21100 and, optionally, computing system(s) not part of analytical computing system 21100. The data integration app software 26603, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the data integration computer 26602 and the cloud platform 22223. The data integration app 26603 can be provided as part of analytical computing system 21100 and/or can be provided by an analytical user or someone working with an analytical user. In one practice, the first interaction for data integration app 26603 with cloud platform 22223 is requesting login services through a service link 26604 to authenticate 26605 with appropriate credentials configured by an administrator that preferably include a unique username and password and can also include an optional or required additional authentication input, commonly referred to as two-factor authentication, previously configured for use by an administrator, wherein, the login service can retrieve the encrypted credentials for data integration app 26603 through service link 26606 from a system database 26607 to verify that the data integration app 26603 can access and use analytical computing system 21100 with the login updating data stored in system database 26607 through the service link 26606 to track usage of the analytical computing system 21100. After a data integration app 26603 is authenticated on login, it can use services provided by application

26609 through use of data integration app 26603 through a service link 26608 to perform analytical functions provided by the application 26609, wherein, these services, as required, use a service link 26610 to create, read, update, and/or delete data stored in a team database 26611 with the use of these services also creating and updating data stored in system database 26607 through the service link 26610 to track usage of the analytical computing system 21100. Ultimately, a data integration app can logout from use of the analytical computing system 21100 via data integration app 26603 through service link 26604 to terminate the current use of analytical computing system 21100 with the logout service of authenticate 26605 updating the data integration app login information through the service link 26606 to system database 26607 with the logout updating data stored system database 26607 through the service link 26606 to track usage of the analytical computing system 21100.

[00469] In FIG. 27 is an embodiment of a user monitoring the use of an analytical computing system 21100 using a support user computer 27702 to run the monitoring user app software 27703 to perform monitoring functions provided by the analytical computing system 21100 through services provided through a cloud platform 22223. The monitoring user app software 27703, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the support user computer 27702 and the cloud platform 22223. The monitoring user app 27703 can be executed on the support user computer 27702 through either a distinct application installed on the support user computer 27702 or accessed via an internet browser installed on the support user computer 27702 pointing to a URL with a web site part of the services provided by cloud platform 22223 logically organized with a dashboard 27709 in this embodiment, but not limited to that organization. In one practice, the first interaction for a support user computer with the cloud platform is through use of the monitoring user app 27703 requesting login services through a service link 27704 to authenticate 27705 with appropriate credentials that preferably include a unique username and password and/or metric identification and could also include an optional or required additional authentication input, commonly referred to as two-factor authentication, previously configured for use by an administrator, wherein, the login service can retrieve a user's encrypted credentials through a service link 27706 from a system database 27707 to verify that the monitoring user can access and monitor the analytical computing system 21100 with the login updating data stored in system

database 27707 through the service link 27706 to track usage of analytical computing system 21100. A monitoring user can also reset their password via the monitoring user app 27703 through service link 27704 to authenticate 27705 if they forgot or do not know their password with the password reset updating data stored in system database 27707 through the service link 27706 to track usage of analytical computing system 21100. A monitoring user can also configure their additional authentication input via the monitoring user app 27703 through service link 27704 to authenticate 27705 so as to retrieve and change the configuration of their additional authentication input through the service link 27706 to the system database 27707 with the configuration change updating data stored in system database 27707 through the service link 27706 to track usage of analytical computing system 21100. After a monitoring user is authenticated on login, they can use services provided by a dashboard 27709 through use of the monitoring user app 27703 through a service link 27708 to perform monitoring functions of the analytical computing system 21100, wherein, these services, as required, use a service link 27710 to create, read, update, and/or delete data stored in system database 27707 with the use of these services also creating and updating data stored in system database 27707 through the service link 27710 to track usage of the analytical computing system 21100. Ultimately, a monitoring user can logout from use of the analytical computing system 21100 via monitoring user app 27703 through a service link 27704 to terminate their current use of the analytical computing system 21100 with the logout service of authenticate 27705 updating the administrator's login information through the service link 27706 to the system database 27707 with the logout updating data stored in system database 27707 through the service link 27706 to track usage of the analytical computing system 21100.

[00470] In FIG. 28 is an embodiment of a support data integration computer 28802 running monitoring data integration app software 28803 to perform monitoring data integration functions provided by the analytical computing system 21100 through services provided through a cloud platform at 22223 between analytical computing system 21100 and, optionally, computing system(s) not part of the analytical computing system 21100. The monitoring data integration app software 28803, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the support data integration computer 28802 and the cloud platform 22223. Thus, the monitoring data integration apps software is adapted to track, review, and/or monitor one or more features of the data integration functions

described herein. In one practice, the first interaction for a monitoring data integration app 28803 with the cloud platform 22223 is requesting login services through a service link 28804 to authenticate 28805 with appropriate credentials configured by an administrator that preferably include a unique username and password and can also include an optional or required additional authentication input, commonly referred to as two-factor authentication, previously configured for use by an administrator, wherein, the login service can retrieve the encrypted credentials for a monitoring data integration app 28803 through a service link 28806 from a system database 28807 to verify that the monitoring data integration app can access and use the analytical computing system 21100 with the login updating data stored in system database 28807 through the service link 28806 to track usage of the analytical computing system 21100. After a monitoring data integration app 28803 is authenticated on login, it can use services provided by a dashboard 28809 through use of the monitoring data integration app 28803 through a service link 28808 to perform monitoring functions provided by dashboard 28809, wherein, these services, as required, use a service link 28810 to create, read, update, and/or delete data stored in system database 28807 with the use of these services also creating and updating data stored in system database 28807 through the service link 28810 to track usage of the analytical computing system 21100. Ultimately, a monitoring data integration app 28803 can logout from use of the analytical computing system 21100 via monitoring data integration app 28803 through a service link 28804 to terminate the current use of the analytical computing system 21100 with the logout service of authenticate 28805 updating the monitoring data integration app login information through the service link 28806 to the system database 28807 with the logout updating data stored in system database 28807 through the service link 28806 to track usage of the analytical computing system 21100.

[00471] In FIG. 29 is an embodiment of a consumable information upload computer 29902 running a consumable information upload app software 29903 to perform consumable information upload functions provided by analytical computing system 21100 via services provided through a cloud platform at 22223 between the analytical computing system 21100 and, optionally, computing system(s) not part of the analytical computing system 21100. The consumable information upload app software 29903, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the consumable information upload computer 29902 and the cloud platform 22223. In one practice,

the first interaction for a consumable information upload app 29903 with the cloud platform at 22223 is requesting login services through a service link 29904 to authenticate 29905 with appropriate credentials configured to preferably include a unique username and password, wherein, the login service can retrieve the encrypted credentials for a consumable information upload app 29903 through a service link 29906 from a system database 29907 to verify that the consumable information upload app can access and use the analytical computing system 21100 with the login updating data stored in system database 29907 through the service link 29906 to track usage of analytical computing system 21100. After a consumable information upload app 29903 is authenticated on login, it can use services provided by upload 29909 through use of the consumable information upload app 29903 through a service link 29908 to perform consumable information upload functions provided by upload 29909, wherein, these services, as required, use the service link 29910 to push data to be stored in consumable content 29911 associated with a particular customer account for subsequent storage to one or more team databases 29913 that are associated with a particular customer account by upload 29909 transferring the data via the service link 29912 with the use of these services also creating and updating data stored in system database 29907 through the service link 29906 to track usage of the analytical computing system 21100. Once upload is complete, a consumable information upload app 29903 can logout from use of the analytical computing system 21100 via consumable information upload app 29903 through a service link 29904 to terminate the current use of analytical computing system 21100 with the logout service of authenticate 29905 updating the consumable information upload app login information through the service link 29906 to the system database 29907 with the logout updating data stored in system database 29907 through the service link 29906 to track usage of the analytical computing system 21100.

[00472] In FIG. 30 is an embodiment of an account information upload computer 301002 running account information upload app software 301003 to perform account update functions provided by analytical computing system 21100 via services provided through a cloud platform at 22223 between the analytical computing system 21100 and, optionally, computing system(s) not part of the analytical computing system 21100. The account information upload app software 30103, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the account information upload computer 301002 and

the cloud platform 22223. The account update functions can include adding, modifying, and/or deleting information as it relates to one more given accounts including, for example, usernames, passwords, permissions, and other attributes associated with one or more individual or team accounts. In one practice, the first interaction for the account information upload app 301003 with cloud platform 22223 is requesting login services through a service link 301004 to authenticate 301005 with appropriate credentials configured that preferably include a unique username and password, wherein, the login service can retrieve the encrypted credentials for an account information upload app 301003 through a service link 301006 from a system database 301007 to verify that the account information upload app can access and use the analytical computing system 21100 with the login updating data stored in system database 301007 through the service link 301006 to track usage of the analytical computing system 21100. After an account information upload app 301003 is authenticated on login, it can use services provided by admin 301009 through use of the account information upload app 301003 through a service link 301008 to perform the account information upload functions provided by admin 301009, wherein, these services, as required, use a service link 301010 to push data to be stored in system database 301007 associated with creating or updating a customer account with the use of these services also creating and updating data stored in system database 301007 through the service link 301010 to track usage of the analytical computing system 21100. Once upload is complete, an account information upload app 301003 can logout from use of the analytical computing system 21100 via account information upload app 301003 through a service link 301004 to terminate the current use of the analytical computing system 21100 with the logout service of authenticate 301005 updating the account information upload app login information through the service link 301006 to the system database 301007 with the logout updating data stored in system database 301007 through the service link 301006 to track usage of the analytical computing system 21100.

[00473] In FIG. 31 is an embodiment of an instrument information upload computer 311102 running instrument information upload app software 311103 to perform instrument information upload functions provided by analytical computing system 21100 via services provided through a cloud platform at 22223 between the analytical computing system 21100, and optionally computing system(s) not part of analytical computing system 21100. The running instrument information upload app software 311103, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the

methodical user interface control system 1102 may be provided by a combination of the instrument information upload computer 311102 and the cloud platform 22223. The first interaction for an instrument information upload app 311103 with the cloud platform at 22223 is requesting login services through a service link 311104 to authenticate 311105 with appropriate credentials configured that preferably include a unique username and password, wherein, the login service can retrieve the encrypted credentials for an instrument information upload app 311103 through a service link 311106 from a system database 311107 to verify that an instrument information upload app can access and use the analytical computing system 21100 with the login updating data stored in system database 311107 through the service link 311106 to track usage of the analytical computing system 21100. After an instrument information upload app 311103 is authenticated on login, it can use services provided by upload 311109 through use of an instrument information upload app 311103 through a service link 311108 to perform instrument information upload functions provided by upload 311109, wherein, these services, as required, use the service link 311110 to create a new instrument on first occurrence of an instrument and push data to be stored in instrument content 311111 associated with the instrument for a particular customer account for subsequent storage to an account in the system database 311107 through the service link 311106 with the use of these services also creating and updating data stored in system database 311107 through the service link 311106 to track usage of the analytical computing system 21100. Once upload is complete, an instrument information upload app 311103 can logout from use of the analytical computing system 21100 via instrument information upload app 311103 through a service link 311104 to terminate the current use of the analytical computing system 21100 with the logout service of authenticate 311105 updating the instrument information upload app login information through the service link 311106 to the system database at 1107 with the logout updating data stored in system database 311107 through the service link 311106 to track usage of the analytical computing system 21100.

[00474] In FIG. 32 is an embodiment of a coordinated-operation instrument computer 321202 running coordinated-operation instrument app software 321203 to perform coordinated-operation instrument functions provided by analytical computing system 21100 via services provided through a cloud platform at 22223 associated with instrumentation processing where a coordinated-operation instrument provides an integration of one or more individual operation instruments; an integration of custom-designed hardware; or a combination of one or more

individual-operation instruments with custom-designed hardware. The coordinated-operation instrument app software 321203, as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the coordinated-operation instrument computer 321202 and the cloud platform 22223. In one practice, the first interaction for a coordinated-operation instrument app 321203 with the cloud platform at 22223 is requesting login services through a service link 321204 to authenticate 321205 with appropriate credentials configured that preferably includes a unique username and password, wherein, the login service can retrieve the encrypted credentials for a coordinated-operation instrument app 321203 through a service link 321206 from a system database 321207 to verify that a coordinated-operation instrument app 321203 can access and use the analytical computing system 21100 with the login updating data stored in system database 321207 through the service link 321206 to track usage of the analytical computing system 21100. The coordinated-operation instrument computer 321202 running coordinated-operation instrument app software 321203 can communicate with a system component 321213 of a services server via a service link 321212, which may communicate with a team database 321211 via a service link 321210; the coordinated-operation instrument computer 321202 running coordinated-operation instrument app software 321203 can communicate with an application component 321209 of a service server via a service link 321208. One or more services server components, e.g., 321213, 321209, 321205, may communicate with a bulk data server, e.g., access instrument content 321215, via a service link 321214.

[00475] In FIG. 33A is an embodiment of an individual-operation instrument computer 331302 running individual-operation instrument app software 331303 to perform individual-operation instrument functions provided by analytical computing system 21100 via services provided through a cloud platform at 22223 associated with instrumentation processing. The individual-operation instrument app software 331303 as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the individual-operation instrument computer 331302 and the cloud platform 22223. In one embodiment, an individual-operation instrument performs one or more logical assay steps on one or more samples in a stepwise process to collect data about the samples under test. In this embodiment, the individual-operation instrument does not perform all assay steps, which can include, without

limitation, steps that relate to a plate reader, plate washer, plate incubator, plate shaker, plate incubator-shaker, pipetting system, or any other type of instrument used in support of analytical sample testing. In other embodiments, the individual-operation instrument can perform all assay steps. The first interaction for an individual-operation instrument app 331303 with the cloud platform at 22223 is requesting login services through a service link 331304 to authenticate 331305 with appropriate credentials configured that preferably includes a unique username and password, wherein, the login service can retrieve the encrypted credentials for an individual-operation instrument app 331303 through a service link 331306 from a system database 331307 to verify that an individual-operation instrument app 331303 can access and use the analytical computing system 21100 with the login updating data stored in system database 331307 through the service link 331306 to track usage of the analytical computing system 21100. In the alternative, the individual-operation instrument computer 331302 can assist in performing other functions in addition to or in place of the assay steps and/or plate-based tests described herein.

[00476] In FIG. 33B is an embodiment of an individual-operation instrument computer 331302 running workflow-aid instrument app software 331331 to perform individual-operation instrument functions provided by analytical computing system 21100 via services provided through a cloud platform at 22223 associated with instrumentation processing. The individual-operation instrument app software 331331 as discussed herein, may employ a MUI as described above to facilitate user access to the functionality provided. As such, embodiments of the methodical user interface control system 1102 may be provided by a combination of the individual-operation instrument computer 331330 and the cloud platform 22223. The workflow-aid instrument helps a user perform collection of assay components used in the processing of the assays in an associated experiment, as well as, preparing bioassay components that require preparation prior to be used in the processing of an assay, for example but not limited to, rehydrating lyophilized reagents, thawing frozen reagents, pretreating samples, and/or any other step required to prepare constituent components to be used in processing one or more assays in a chosen experiment. The first interaction for an workflow-aid instrument app 331331 with the cloud platform 22223 is requesting login services through a service link 331332 to authenticate 331333 with appropriate credentials configured with preferably unique username and password, wherein, the login service would retrieve the encrypted credentials for an workflow-aid instrument app 331331 through a service link 331334 from system database 331335 to verify a workflow-aid instrument app 331331 may

access and use the analytical computing system 21100 with the login updating data stored in system database 331335 through the service link 331334 to track usage of the analytical computing system 21100. After workflow-aid instrument app 331331 is authenticated on login, it will use services provided by application 331337 through use of a workflow-aid instrument app 331331 through a service link 331336 to perform workflow-aid instrument app functions provided by application 331337 wherein, these services as required use the service link 331338 to retrieve experiments ready to be processed 331339; to store data 331339 as an experiment is processing; and/or to store data 331339 after an experiment completes processing, with the use of these services also creating and saving data stored in system database 331335 through the service link 331334 to track usage of the analytical computing system 21100. Once a user has completed use of a workflow-aid instrument app 331331, they could logout from use of the analytical computing system 331300 via workflow-aid app 331331 through a service link 331332 to terminate the current use of the analytical computing system 21100 with the logout service of authenticate 331333 updating a workflow-aid instrument app login information through the service link 331334 to the system database 331335 with the logout updating data stored in system database 331335 through the service link 331334 to track usage of the analytical computing system 21100.

[00477] In FIG. 34A and FIG. 34B is a combined embodiment of software architecture for services deployed on cloud platform 22223. Scalable computing service 341401 associated with cloud platform 22223 provide a secure computing environment for scaling the server utilization of services servers 341406 as system computing requirements change, as well as supporting the building of failure-resilient applications and isolating them from common failure scenarios. Bulk storage service 341402 associated with cloud platform 22223 provides unlimited data storage space in a highly available and durable way for any kind of data to be stored, such as images, video, documents, binary data files, and/or other types of files. Database service 341403 associated with cloud platform 22223 provides a secure, distributed, scalable database system used to store structured data for applications and system, supporting and easily distributing one or more databases across one or more servers. Lambda function service 341404 associated with cloud platform 22223 provides an event-driven computing platform for running special-built utility applications in response to configured events, while automatically managing computing resources required by these special-built utility applications. Load balancing service 341405 with cloud platform 22223 provides distribution of incoming service requests from clients across multiple

services servers 341406 to meet continuous performance demands, as well as performing health checks on the scalable computing service 341401 to ensure the service is operational before sending requests and providing an extra security layer by isolating the scalable computing service 341401 from direct access from the internet. Logical collection of authenticate services 341407 deployed on services servers 341406 provides login services 341408 supporting a user logging in with username and password with strong password policy and customizable password expiration period; and services 341409 supporting two-factor authentication (2FA) for a supplemental method of confirming a user's claimed identity by using another form of authentication other than a username and password, for example using a Time-based One-time Password algorithm (TOTP) optionally configured on or off for an account. Logical collection of admin services 341410 deployed on services servers 341406 provides account services 341411 supporting account preparation, team creation, team administration, software releases, and instrument service plan; and team services 341412 supporting managing team membership, defining role permissions per each module, assigning users one or more roles, and notifying users via email of key events in the system pertinent to them. Logical collection of dashboard services 341413 deployed on services servers 341406 provides performance data services 341414 supporting gathering use and performance data from all instruments and consumables in the field operating within the system for analysis and presentation as well as, supporting export of this data to external systems; and account services 341415 providing visibility into the structure and operation of various teams and their users in an account plus across all accounts and supporting export of this data to external systems, as well as providing ability to monitor and disable suspicious and/or undesired behavior. Logical collection of upload services 341416 deployed on services servers 341406 provides instrument information services 341417 supporting import of instrument information from external systems for an account and teams associated with an account; and consumable information services 341418 supporting import of consumable information from external systems for an account and teams associated with an account. Logical collection of system services 341419 deployed on services servers 341406 providing performance data upload services 341420 supporting storing instrument and consumable performance data from instruments in the field operating within the system to be stored using bulk storage service 341402; and content services 341421 supporting dissemination of user manuals and application installers for various versions of applications.

[00478] Logical collection of application services 341422 deployed on services servers 341406 providing plate services 341423 supporting storing for a user plate data, including signal, plate identifier, username who processed the plate, timestamp of execution, and plate type, in a team database associated with the requesting user; audit log services 341424 supporting capturing time-stamped events linked to a user's actions with data and services in the system to be stored in the team's database associated with a user performing the actions; experiment services 341425 supporting creating an experiment with selected assay methods and samples to process, committing an experiment for execution and storing to a requesting user's team database, retrieving plate data from instruments to store with an experiment in a requesting user's team database, retrieving a collection of recent or all experiments from a requesting user's team database, initiating calculation of results using one or more associated analysis methods and storing to a requesting user's team database, and retrieving a specific experiment with its plate data including calculated results from a requesting user's team database; assay method services 341426 supporting retrieving a collection of recent or all assay methods from a requesting user's team database, retrieving a specific assay method from a requesting user's team database with assay method configuration data including but not limited to assay method name, associated assays to be tested, layout of different sample types being optionally calibrators, optionally controls, optionally blanks, and optionally samples (i.e., unknowns), analysis method assignments to the assay method as well as optionally to one or more assays associated with the assay method, and protocol parameters configuring the performance of the assay method either manually or automatically, and committing the assay method for use storing it in the requesting user's team database; and data analysis services 341427 supporting retrieving a collection of recent or all analysis methods from a requesting user's team database, retrieving a specific analysis method from a requesting user's team database with analysis method configuration data including but not limited to analysis method name, algorithm and associated configuration, background detection configuration, and limits of detection configuration, and committing the analysis method for ultimate use storing it in the requesting user's team database. In the alternative, the logical collection of application services 341422 can assist in performing other services in addition to or in place of the assay services and/or plate based tests described herein.

[00479] In FIG. 35A is an embodiment of a logical design for system data for the analytical computing system with the data entities organized in logical groups as defined by Account and

Team 351500, Instrument and Service Plan 351501, User and Role 351502, Software Release 351503, Multi-Region 351504, and Audit Trail 351505, wherein, Account and Team 351500 includes one or more data entities associated with managing an account of users organized into teams on the analytical computing system; Instrument and Service Plan 351501 includes one or more data entities associated with instrumentation used in conjunction with the analytical computing system; User and Role 351502 includes one or more data entities associated with managing the users assigned to zero or more teams on the analytical computing system; Software Release 351503 includes one or more data entities associated with managing new releases of software for the analytical computing system; Multi-Region 351504 includes one or more data entities associated with managing deployment of an account on a cloud platform providing support for a geographically distributed computing environment providing localized performance improvement and/or meeting governmental restrictions such that an account could be located to a desired geographical location; and Audit Trail 351505 includes one or more data entities associated with capturing a log of actions performed by administrators of the analytical computing system. Account and Team 351500 having a data entity 351506 representing one or more accounts on the analytical computing system where each account has associated with it a data entity 351509 representing one or more teams organized within an account and a data entity 351507 representing a company establishing a specific account for which is a data entity 351508 representing a contact who is responsible for preparing use of the account for a company, such that each company 351507 can have more than one account associated with it as prepared by a specific primary contact 351508. Instrument and Plan 351501 has a data entity 351513 representing one or more instruments to be used in conjunction with an account on the analytical computing system where each instrument has associated with it a data entity 351511 representing the ship-to address associated with a data entity 351510 representing a parent company to which the associated instrument was shipped, such that a Parent Company 351510 may have associated with it one or more Ship-To Addresses 351511 that in turn can have associated with it one or more Instruments 351513 that have associated with each instrument a data entity 351512 representing a service plan either active or inactive for an instrument that itself is associated with an Account 351506 to aid an administrator in managing service plan renewals of one or more instruments potentially in use with the account on the analytical computing system. User and Role 351502 has a data entity 351514 representing a distinct user of the analytical computing system associated with one or more

teams 351509 prepared for an Account 351506 where each user has for a team an association with a data entity 351515 representing a role in the use of the analytical computing system with a prescribed set of software function permissions as defined in the associated data entity 351516 derived from the permissions defined by the data entity 351518 associated with the data entity 351517 representing each software module in the analytical computing system, such that, a distinct User 351514 may participate with one or more teams 351509 where each team could be in the same or different accounts 351506 and the user assuming one or more roles 351515 for each team that enables and disables one or more functions of the software as configured for each role 351516. Software Release 351503 has a data entity 351519 representing the overarching software release of a collection of one or more applications in the analytical computing system as represented by the data entity 351520, such that each Account 351506 is using a particular software release 351519 and may upgrade to one of one or more new software releases 351519, but all users 351514 associated with an Account 351506 have up to upgrade to the new software release 351519 when an Account 351506 performs the upgrade. Multi-Region 351504 has a data entity 351522 representing the geographical region supported by the cloud platform and associated a data entity 351523 representing the database server for user for creating databases for use, such that, an Account 351506 is associated with a specific geographical region 351522 to which all of its Teams 351509 will have their associated databases 351523 created for use by each respective team so that only Users 351514 assigned to a Team 351509 may access the assigned database created 351523. Audit trail 351505 includes data entity 351524 representing an audit event. Software release 351503 can include version control 351521, which is adapted to document, maintain, and/or track previous versions of the Software release 351503. In one embodiment, version control 351521 includes information as it relates to the existing version and all previous versions of Software release 351503 along with information to changes to the software that propagated through the various versions of the software. Moreover, version control 351521 can include information as it relates to future plans for additional revisions to Software release 351503. Audit trail 351505 can further include an audit event 351524, which can be used to trigger a system audit and/or audit various user- or instrument-based operations.

[00480] In FIG. 35B is an embodiment of a mapping between one or more business entities 351570 and 351576 using an analytical computing system 351581 to the analytical computing system 351581 through the cloud platform 351582 used in delivering electronic information about

purchased products as the products prepared for physical shipping. Business entity 351570 can include, but is not limited to, a corporation, limited liability company, sole proprietorship, non-profit company, academic institution, government agency or affiliate, private individual or group of individuals, research institute, or any other type entity using the analytical computing system 351581, wherein the business entity 351570 is described by parent business information 351571 that can have associated with it zero or one or more ship-to addresses 351572 and 351574, wherein the ellipse 351573 illustrates the potential for zero or one or more ship-to addresses, where each ship-to is a unique address to which the business entity 351570 wants products it purchases to be delivered for ultimate use within the targeted business entity. The ship-to 351572 labelled "A" and the ship-to 351574 labelled "Z" is merely illustrative as any number of ship-to addresses associated with any business entity are contemplated. A business entity 351570 or 351576 can have zero ship-to's associated with it such that it purchases one or more products to be delivered to some other business entity; regardless, each business entity can have an account with the analytical computing system 351581. As shown by element 351575, there can be zero or more business entities as depicted 351570 and 351576 using the analytical computing system 351581, but the parent information 351571 labelled "A" and the parent information 351577 labelled "Z" illustrates up to 26 business entities 351570 and 351576 with their respective parent information 351571 and 351577, but any other number is contemplated as well. Similarly, the business entity 351576 can be described by parent business information 351577 that can have associated with it zero or one or more ship-to addresses 351578 and 351580, with an wherein the ellipse 351579 to illustrates the potential for zero or one or more ship-to addresses, where each ship-to is a unique address to which the business entity 351576 wants products it purchases to be delivered for use within the targeted business entity. The ship-to 351578 labelled "A" and the ship-to 351580 labelled "Z" represents 26 ship-to's associated with any business entity, but any other number is contemplated as well. 351581 is the analytical computing system with its associated computing platform 351582 and its system database 351583 and consumable content 351585 wherein the system database 351583 has stored with it in part a collection of data 351584 being account information of business entities using the analytical computing system 351581 having an auto-generated unique identifier from cloud platform 351581 for tracking a business entity's use of the analytical computing system 351581 along with the account's identifier being associated with the unique identifier of the business entity in this example of an embodiment being either Parent A ID

for business entity 351570 or Parent Z ID for business entity 351576, while also being depicted that a business entity could have more than one account on the analytical computing system 351581 since Parent Z ID is repeated; and consumable content 351585 having stored with it a collection of purchased consumable content being the general and lot-specific content for a purchased product as shipped to a business entity, Parent A ID being the business entity 351570 and Parent Z ID being the business entity 351576, to particular ship-to addresses of the associated business entity 351570 and 351576, where the ship-to addresses are unique within a business entity 351570 and 351576, but not necessarily unique between the two business entities, which is to say, two different business entities can share a common ship-to address, such that the cloud platform 351581 may transfer consumable content to each account on the analytical computing system that can desire to use a purchased consumable available to it as determined through the PARENT ID mechanism of ACCOUNT 351584 mapped to the associated ship-to's as defined in consumable content 351585.

[00481] In FIG. 35C is an embodiment of a logical design for data representing plate data generated by a user for a team using instrumentation in conjunction with the analytical computing system with the data entities 351599 logically organized have a data entity 351594 representing a physical plate processed and/or analyzed by instrumentation where each plate has an association with a data entity 351595 representing a definition of how many measurements of the possible measurements this plate will provide for each tested sample; an association with a data entity 351596 representing the collected data produced from the plate; an association with a data entity 351597 representing the configuration of the instrumentation used to produce the collected data; and an association with a data entity 351598 representing any abnormal events that might have occurred on the instrumentation in the process of producing the collected data 351596 from the plate 351594. Although this embodiment describes plate-reader operations and/or applications, the methods described herein can be applied in the alternative to the logical design of other experiments and tests in the alternative.

[00482] In FIG. 35D is an embodiment of a logical design for data representing methods for performing assays in the analytical computing system with the data entities 351569 logically organized having a data entity 351560 representing a named assay method to be performed using consumables and instrumentation where each assay method has an association with a data entity 351561 representing a named method by which data collected from instrumentation is post-

analyzed to provide assay context to the collected data in association with a data entity 351566 representing the configuration of settings relevant to a prescribed analysis as well as an optional association with a data entity 351567 representing the configuration of settings relevant to a prescribed analysis leveraging a curve fitting technique; an association with a data entity 351562 representing a definition of how many measurements of the possible measurements this plate will provide for each tested sample; an association with a data entity 351563 representing a definition of the available measurements each plate will provide for each tested sample in association with a data entity 351568 representing the specific assay to be measured; an association with a data entity 351564 representing general information about a consumable to be used with the assay method; and an association with a data entity 351565 representing a definition of the layout of various types of samples to be dispensed on a plate where the types of samples are calibrators, controls, blanks, and samples (also referred to as unknowns or samples under test), such that, the collection of these data entities provides the assay-specific context to help a user determine what the measured data collected from instrumentation means about the samples they are testing. Although this embodiment describes methods for performing assays and/or plate-based tests, other experiments and tests are contemplated as well.

[00483] In FIG. 35E is an embodiment of a logical design for data representing a collection of plates organized to be processed together or independently, either way a unit of schedulable work referred to as a run, with the data entities 351592 logically organized having a data entity 351586 representing a run to be processed using instrumentation with the run having an association with a data entity 351594 representing a physical plate processed by instrumentation; an association with a data entity 351560 representing each assay method used with each corresponding plate for the run; an association with a data entity 351588 representing a run record; and an association with a data entity 351589 representing a system record. The data entity 351588 has associations with a data entity 351590 representing a kit inventory record and with a data entity 351591 representing a sample layout. Although this embodiment describes plate-based operations and/or applications, the methods described herein can be applied in the alternative to the review of other experiments and tests in the alternative.

[00484] In FIG. 35F is an embodiment of a logical design for data representing the definition of a collection of sample(s) to be measured, assay method(s) to be used to prepare the samples to be measured on plates, and analysis results determined from the measured data using analysis

algorithm(s) defined in association with an assay method and/or its constituent assays, all referred to as an experiment, with data entities 351542 logically organized having 351535 a data entity representing an experiment to be processed using instrumentation with the experiment having an association with a data entity 351536 representing a plate processed in the context of an experiment where one or more of these processed plates are associated with a run 351586 and associations with data entities 351539 and 351541 used to post-analyze the measured data from a plate using assay method setup to determine results 351540; an association with a data entity 351537 representing a specification of the structure of data table to be presented for the measured data from plates; and an association with a data entity 351538 representing a collection of sample statistics determined from the measured and analyzed data. Although this embodiment describes methods for performing assays and/or plate-based experiments, other experiments and tests are contemplated as well.

[00485] In FIG. 36A is an embodiment of an example of account structure for users of analytical computing system 361600, but this example is not intended to limit the account structure in any way since the analytical computing system 361600 can support an infinite number of accounts, an infinite number of teams in an account, and an infinite number of administrators and/or other users assigned to accounts and/or teams. In the example for this embodiment there are shown four accounts prepared on analytical computing system 361600 as represented by Account 1 361601, Account 2 361602, Account 3 361603, and Account 4 361604, these account names used to aid in the example. Each account has associated with it one or more teams where, Account 1 361601 has one team named Team with a team database 361607 dedicated to that team; Account 2 361602 has one team named Team to illustrate team names are only unique within an account, also with its dedicated team database 361611; Account 3 361603 has two teams named Team 1 361615 with its dedicated team database 361617 and Team 2 361616 with its own dedicated team database 361618; and Account 4 361604 has two teams named Team A 361626 with its dedicated team database 361628 and Team B 361627 with its own dedicated team database 361629. The users in the various accounts and teams are uniquely named as well to illustrate users can be uniquely named for easy end-user identification with User 1 361605 and 361608, User 2 361609 and 361623, User 3 361612, User 4 361613, User 5 361614, User 6 361619 and 361622, User 7 361620 and 361633, User 8 361621, User 9 361624 and 361630, User 10 361625, User 11 361631, and User 12 361632, but in the preferred embodiment the username would be a fully expressed unique

email address and/or username of a user, simplified for this example. Additionally User 1 361605 illustrates a user could be an account admin, a team admin, and/or a team member; User 2 361609 illustrates a user could only be an account admin and a team admin; User 2 361623 illustrates a user could only be an account admin and also illustrates a user could be an admin of more than one account; User 5 361614 illustrates a user could be a team admin for more than one team; User 6 361619 and 361622 illustrates a user could be a team member of more than one team in an account; User 7 361620 and 361633 illustrates a user may be a team member of more than one team in more than one account; User 9 361624 illustrates a user could be a team admin and a team member (e.g., shown 361630); User 10 361625 illustrates a user could only be a team admin; User 3 361612, User 4 361613, User 6 361619, User 7 361620 and 361633, User 8 361621, User 11 361631, and User 12 361632 illustrates users could only be assigned as a team member with no administrative permissions; and not explicitly illustrated but should be obvious is there are no constraints placed by the system on how a particular user is assigned to an account and teams associated with an account, since user assigned is fully the responsibility of the person or people managing an account and team(s) associated with an account. Additionally the analytical computing system 361600 in a preferred embodiment would provide a role-based permission mechanism beyond account administrator and team administrator to help control access to various system functions of the analytical computing system 361600 for various users on a team in an account where predefined and user-changeable user roles could be but not limited in name and/or number to lab manager, designer, associate, operator, and maintenance technician; such that, an account administrator would have permissions associated with managing an account shared by users on all teams; a team administrator would have permissions associated with managing user participation on a team; a lab manager could have permissions with greatest responsibility compared to other roles for users on a team; a designer and associate could have permissions different than each other befitting each of their normal job functions; an operator could only have permissions for normal operation of instrumentation; and a maintenance technician could only have permissions for maintenance and diagnosis of instrumentation, where a user could be assigned more than one role and given permissions aggregated across the assigned roles, hence, as an example User 1 361605 would have account permissions for Account 1 361601, team administration of Team 361606 plus whatever other permissions based on the role(s) User 1 361605 assigned themselves as the team administrator.

[00486] In FIG. 36B is an embodiment of the computing flow for creation and update of an account on the analytical computing system 361654. The computing flow of the account information upload app 361653 may be managed, for example, by a MUI provided via methodical user interface control system 1102 operating, at least in part, on the account information upload computer 361652 and the analytical computing system 361654. For example, an admin module may be used to manage the interface embodiments of the computing flow. The flow is represented in a “swim lane” diagram depicting independent computing systems, analytical computing system provider business system 361651, account information upload computer 361652, and cloud platform 361655, each operating concurrently to each other with processing swim lanes for analytical computing system provider business system 361651 depicted between lines 361659 and 361660, processing swim lanes for account information upload computer 361652 with its software application account information upload app 361653 depicted between lines 361660 and 361661, and processing swim lanes for cloud platform 361655 with its software account services 361658 depicted between lines 361661 and 361662. The processing of analytical computing system provider business system 361651 is depicted as out of scope for the analytical computing system 361654 with the dotted-line outline of analytical computing system provider environment 361650, but other embodiments are contemplated as well. Analytical computing system provider business system 361651 can cause generation of a request for a new account 361163 or an update to an existing account 361669. The interface mechanism for processing between analytical computing system provider business system 361651 and account information upload app 361653 occurs through a messaging mechanism 361664 that can be a file share, a message queue like Java Messaging Service, Microsoft Message Queue or some other queuing service, email, or some other mechanism for software applications to communicate with each other, wherein the processing 361663 can be to prepare a message with proper format and content per a prescribed interface definition with information about an account defined in the analytical computing system provider business system 361651 and post it to the messaging mechanism 361664 for ultimate processing by the account information upload app 361653. First flow to be described is account creation as initiated 361663 to generate new account request based on an event that occurs in the analytical computing system provider business system 361651 by posting a message via messaging mechanism 361664 with information including, but not limited to, the account number as managed by analytical computing system provider business system 361651, primary contact information

including but not limited to name, business contact address and phone number, the email address of the first person the analytical computing system 361654 automatically contacts to initiate their setup and use of the analytical computing system 361654, the unique identifier for the account in the analytical computing system provider business system 361651, and any other information deemed necessary for an account. The message is received at step 361665 and checked for the type of message being received first for a request to create an account at step 361666 then for updating an account at step 361671 and if neither posting an error message at step 361676 to messaging mechanism 361664 and returning wait for the next message at step 361665. On receiving a create account request at step 361666, a create account request is constructed at step 361667 from the message content received from messaging mechanism 361664 to post at step 361668 using the cloud platform 361655, e.g., using services server 361656 which may include admin functionality or component 361657, wherein on receipt of the post it is verified at step 361669 to ensure the request has all relevant content and on failure returning an error response at step 361668 and on success create the account at step 361670 and store all of the account information in the create post in the system database on the cloud platform 361655 and making the primary contact identified in the create post the first account administrator for the new account emailing the primary contact with instructions of how to log into the analytical computing system 361654 returning success to the requester at step 361668, and returning at step 361667 the account information upload app 361653 to waiting for a message 361665. On receiving an update account request 361671, an update account request is constructed 361672 from the message content received from messaging mechanism 361664 to post at step 361673 using the cloud platform 361655, wherein on receipt of the post it is verified at step 361674 to ensure the request has all relevant content and on failure returning an error response at step 361673 and on success update the account at step 361675 and store all of the account information in the update post in the system database on the cloud platform 361655, returning success to the requester at step 361673, and returning at step 361672 the account information upload app 361653 to waiting for a message at step 361665.

[00487] In FIG. 36C is an embodiment of the computing flow for instrument association with an account on the analytical computing system 361654. The computing flow of the instrument information upload app 361637 may be managed, for example, by a MUI provided via methodical user interface control system 1102 operating, at least in part, on the instrument information upload

computer 361636 and the analytical computing system 361654. For example, an admin module may be used to manage the interface features of the computing flow. The flow is represented in a “swim lane” diagram depicting independent computing systems, instrumentation provider business system 361635, instrument information upload computer 361636, and cloud platform 361655 (which may include services server 361656 providing, e.g., an admin functionality or component 361657), each operating concurrently to each other with processing swim lanes for instrumentation provider business system 361635 depicted between lines 361659 and 361698, processing swim lanes for instrument information upload computer 361636 with its software application instrument information upload app 361637 depicted between lines 361698 and 361699, and processing swim lanes for cloud platform 361655 with its software account services 361658 depicted between lines 361699 and 361662. The processing of instrumentation provider business system 361635 is depicted as out of scope for the analytical computing system 361654 with the dotted-line outline of instrumentation system provider environment 361634, but other embodiments are contemplated as well. Instrumentation provider business system 361635 results in a generation of a request for a new instrument purchase at step 361638, a request for an instrument evaluation at step 361648, or a request for an instrument lease 361649, wherein, each request results in a ship of the instrument at step 361639. The interface mechanism for processing between instrumentation provider business system 361635 and instrument information upload app 361637 occurs through a messaging mechanism 361640 that can be a file share, a message queue like Java Messaging Service, Microsoft Message Queue or some other queuing service, email, or some other mechanism for software applications to communicate with each other, wherein the processing at step 361638 and at step 361648 and at step 361649 can be to prepare a message with proper format and content per a prescribed interface definition with information about an instrument purchase at step 361638, evaluation at step 361648, or lease at step 361649 including the ship-to address defined in the instrumentation provider business system 361635 and post it to the messaging mechanism 361640 for ultimate processing by the instrument information upload app 361637. The resulting flow on purchase at step 361638, evaluation at step 361648, or lease at step 361649 is identical so the description can focus on new instrument purchase as initiated at step 361638 to generate new instrument purchase request based on an event that occurs in the instrumentation provider business system 361635 by posting a message via messaging mechanism 361640 with information including, but not limited to, the account number of the analytical

computing system to which the instrument will be assigned as managed by instrumentation provider business system 361635, instrument serial number, the unique identifier of the parent company of the organization expecting the instrument(s), and the unique identifier of the ship-to location to which the instrument will be shipped as managed by the instrumentation business system 361635, the service plan details associated with duration of the plan and the available number of seats for users to use the analytical computing system 361654, and any other information deemed necessary for an account on the analytical computing system 361654. The message is received at step 361641 checking the message at step 361642 to confirm it is assigning an instrument to an account and if the message is assigning an instrument to an account then processing continues at step 361643 but if not processing continues at step 361647 to post an error message to messaging mechanism 361640 and returning to get messages at step 361641. On receipt of a correct instrument assignment request 361642, processing continues at step 361643 to construct from the message content received from messaging mechanism 361640 a request and put at step 361644 using the cloud platform 361655, wherein on receipt of the put it is verified at step 361645 to ensure the request has all relevant content and on failure returning an error response at step 361644 and on success assigning the instrument to the account at step 361646 and storing all of the instrument information in the put request in the system database for the account on the cloud platform 361655 returning success to the requester at step 361644, and returning at step 361643 the instrument information upload app 361637 to waiting for a message at step 361641.

[00488] In FIG. 36D is an embodiment of the computing flow for consumable association with an account on the analytical computing system 361654. The computing flow of the consumable information upload app 361683 may be managed, for example, by a MUI provided via methodical user interface control system 1102 operating, at least in part, on the consumable information upload computer 361682 and the analytical computing system 361654. For example, an admin module may be used to manage the interface features of the computing flow. The flow is represented in a “swim lane” diagram depicting independent computing systems, consumable provider business system 361681, consumable information upload computer 361682, and cloud platform 361655, each operating concurrently to each other with processing swim lanes for consumable provider business system 361681 depicted between lines 361659 and 361696, processing swim lanes for consumable information upload computer 361682 with its software application consumable information upload app 361683 depicted between lines 361696 and

361699, and processing swim lanes for cloud platform 361655 (e.g., services server 361656 which may include admin functionality or component 361657) with its software account services 361658 depicted between lines 361699 and 361662. The processing of consumable provider business system 361681 is depicted as out of scope for the analytical computing system 361654 with the dotted-line outline of consumable system provider environment 361680, but other embodiments are contemplated as well. Analytical computing system 361654 results in a generation of a request for a new consumable purchase at step 361684 with each request resulting in a ship of a consumable at step 361685. The interface mechanism for processing between consumable provider business system 361681 and consumable information upload app 361683 occurs through a messaging mechanism 361686 that can be a file share, a message queue like Java Messaging Service, Microsoft Message Queue or some other queuing service, email, or some other mechanism for software applications to communicate with each other, wherein the processing at step 361685 can be to prepare a message with proper format and content per a prescribed interface definition with information about a consumable purchase as well as lot-specific content associated with the consumable(s) being purchased, including the unique identifier of the parent company expecting the consumable(s), and the unique identifier of the ship-to address defined in the consumable provider business system 361681, and post it to the messaging mechanism 361686 for ultimate processing by the consumable information upload app 361683. The resulting flow on purchase at step 361684 generates a new consumable purchase request based on an event that occurs in the consumable provider business system 361681 by posting a message via messaging mechanism 361686 with information including but not limited to the barcodes of constituent components associated with a consumable, general and lot-specific content associated with the consumable, the unique identifier of the parent company, and the unique identifier of the ship-to location to which the consumable(s) will be shipped as managed by the consumable business system 361681 and any other information deemed necessary for an account on the analytical computing system 361654. The message is received at step 361687 checking the message at step 361688 to confirm it is assigning a consumable to a site account and if the message is assigning a consumable to a site account then processing continues at step 361689 but if not processing continues at step 361693 to post an error message to messaging mechanism at step 361686 and returning to get messages at step 361687. On receipt of a correct consumable purchase request at step 361688, processing continues at step 361689 to construct from the message content received

from messaging mechanism 361686 a request and post it at step 361690 using the cloud platform 361655, wherein on receipt of the post at step 361690 it is processed to store the new consumable information to consumable content on the cloud platform organizing the content on consumable content by parent account provided with the new consumable information for ultimate dissemination to instrument(s) and account(s) associated with the ship-to associated with the consumable, posting an event to trigger the ultimate dissemination to account(s) associated with the ship-to of the consumable returning success to the requester at step 361690, and returning at step 361689 the consumable information upload app 361683 to waiting for a message at step 361687. At step 361692 processing triggered by an event being delivered at step 361691 that initiates the deployment of all new consumable information to one or more accounts associated with ship-to's of the new consumables via the unique identifier of the parent company expecting the consumable(s).

[00489] In FIG. 37 is an embodiment of software modules in administrator app 371700 forming the primary user interface experience for administrative work typically but not limited to using data configured and generated through the use of services provided by cloud platform 371704 to create, read, update, and/or delete any and all data relevant to each module's processing, as well as any other services needed for each module's processing, wherein admin console module 371701 can be the active module by default when the administrator app 371700 starts. Admin audit trail module 371702 provides visibility into the actions various account admins and/or team admins perform in the administrator app 371700. Collection of system functions 371703 provides typical utilities in support of use of a system such as but not limited to logging off, viewing help information, viewing user guide, viewing legal notices and/or documents, changing user password, and/or other utilities. The collection of system function 371703 may be provided as a separate MUI module and/or a series of software protocols that operate alongside the other discussed MUI modules. As discussed above, the administrator app 371700 may employ a MUI supplied by a methodical user interface control system 1102 for interface purposes. The admin console module 371701, the admin audit trail module 371702, and the system functions 371703 may all employ a MUI for user interface purposes. A user will log into the administrator app 371700 through system functions 371703 using services provided by cloud platform 371704. If authentication of an administrator by a login service on cloud platform 371704 returns an administrator has more than one account, an administrator could be required to select the default account, but if an administrator

does not belong to more than one account and/or team, the service on the cloud platform 371704 can auto-assign an administrator to the sole account for that administrator. On completing login, the user lands at start of the admin console module 371701 and begins using the administrator app 371700 as they need.

[00490] In FIG. 38A is an embodiment of a user experience flow through admin console module for an account admin whose responsibilities are to administer the overall account for an analytical computing system, as well as, administering all teams associated with an account using administrator app at 381800 running on an admin's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for an admin as depicted in administrator app at 381800 being labelled "1." The user experience flow of FIG. 38A may be managed by a MUI as discussed herein. FIGS. 38D-38H provide screenshots illustrating embodiments of the experience flow illustrated in FIG. 38A. At 381801 an admin is requested to login and in this case the authentication service on the cloud platform recognizes the user logging in is identified as an account administrator per user configuration allowing the user to log in and if not recognized as an account administrator denied access with an error message informing the user. At 381810 the user interface auto-transitions to presenting a first menu of options including prepare teams at 381811, define administrators at 381812, manage teams at 381815, and/or update account at 381822. On selecting prepare teams at 381811 user interface presents an execution menu including information on the number of seats available for an account, the maximum number of teams an account may have, and the current set of named teams, if any. A field to enter a new team name is provided with an execution function that will initiate the creation of new teams. The user may type in a unique team name and presses enter. The team name, if unique, is added to the set of teams ready to be created for the account on initiating execution function, with the execution function invoking service(s) on the cloud platform to create each new named team for an account in the system database and create a new team database on a database server using database service, as well as updating the new team database(s) through a lambda service invoked on the cloud platform to populate consumable information from consumable content for potential use by each new team. Subsequent to execution, the user interface transitions back to start at 381810 to display the first menu again. Additionally, at 381811 an account admin can change the name of a previously created team.

[00491] On selecting define administrators at 381812, transitions the user interface to present the set of account admins, as well as admins for each team created in prepare at 381811, a second menu of options is presented including account administrators at 381813 and team administrators at 381814. The first menu may be relocated to an historical portion of the MUI. A user can optionally navigate to an execution menu under account administrators at 381813 to add users named by unique username to the set of account admins or to remove a previously defined account admin for which on completion of the add or remove invokes a service on the cloud platform to update the account admin information in system database and notify the added account admin via email and/or other electronic communication mechanism. The user may also optionally navigate to an execution menu under team administrators at 381814 for one or more teams to add users named by unique username to the set of the associated team's admins or remove previously defined team admins for which on completion of the add or remove invokes a service on the cloud platform to update the team admin information in system database and notify the added team admin(s) via email and/or other electronic communication mechanism, where by default each account admin would be assigned as a team admin to each team to simplify team admin setup.

[00492] On selecting manage teams at 381815 from the first menu, the system relocates the first menu to a historical portion and presents a list of the one or more teams being administered as a second menu (not shown). After selecting a team from the second menu, a third menu of items including define roles and permissions 361816, add/remove members at 381817, assign roles to members at 381818, and/or authorize and notify members at 381819. On selecting define roles and permissions at 381816 a user is provided an execution menu presenting options to configure each role in the system on a module-by-module basis based on all of the modules available in the analytical computing system is presented. A user may also change one or more of the default roles names to whatever they want. On selecting add/remove members at 381817 a user is provided an execution menu presenting the collection of usernames identified as members of the team, as well as the open seats available for new members, and enabling an account administrator to enter new member usernames to add members if there are open seats and/or remove existing members using services on the cloud platform to update account team configuration on each request updating the open seats available. On selecting assign roles to members at 381818 a user is provided an execution menu presenting the collection of members with the ability to turn on or off each role available for the account member by member, using services on the cloud platform to update

account team configuration on each request. On selecting authorize and notify members at 381819 a user is provided an execution menu presenting a synopsis of all members and their assigned roles with an authorize and notify option to notify new members of being added to a team if any and/or informing existing members of changes to their assigned role(s) if any. The notification may be invoked through a service request on cloud platform causing an email and/or other electronic communication mechanism to be sent to each affected user, and on completing transitioning the user interface back to manage teams at 381815, also shown at 381821.

[00493] On selecting update account at 381822 the MUI transitions the user interface to present a second menu of item to view software releases and renewals associated with the account. On selection of releases at 381823 the account administrator is presented information displaying the status of the current release as well as available new releases. On selecting to upgrade to a new software release affecting the entire account the user interface transitions to an execution menu for scheduling the software update at 381824 presenting an account admin a function to set the date and time for the update to occur. On acceptance of an admin's configuration invoking a service on the cloud to store the scheduled update in system database, the MUI transitions back to releases at 381823 and displays the scheduled date and time associated with the view of software releases, and notifies all account members via email and/or other electronic communication mechanism of the impending update and periodically notifying the account members at various configurable date/time intervals so they are fair warned of an approaching update. When the update occurs, the system locks the account from use until such time as the software and database(s) for an account have been updated per the software release. Additionally, an account admin may cancel or change the date and time of an update at any time prior to the update occurring through selecting the scheduled date and time for a software release to transition to schedule update at 381824 to either cancel or change the data. On selecting renewals at 381825 the account administrator is presented renewal status for all instrumentation associated with the account, as well as, the available number of user seats for the account.

[00494] In FIG. 38B is an embodiment of a user experience flow through admin console module for a team admin whose responsibilities are to administer one or more teams associated with an account with administrator app at 381800 running on an admin's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for an admin as depicted in administrator app at 381800 being labelled "1." as the first

step. The user experience flow of FIG. 38A may be managed by a MUI as discussed herein. Thus, as an admin works through the flow of the user interface, they may easily back track to one or more previous steps through historical portions displaying previous menus. At 381801 an admin is requested to login and in this case the authentication service on the cloud platform recognizes the user logging in is identified as a team administrator per user configuration allowing the user to log in and if not recognized as a team administrator denied access with an error message informing the user. At 381810 the user interface automatically selects manage teams at 381815 as a first menu item because the user is identified as only a team administrator that has no additional account administration permissions. The team administrator is then presented with a second menu (not shown) permitting the selection of a team. After selection of a team from the second menu, the MUI may move to the third menu, which display options for managing the team selected in the second menu, including the options for each managed team being to define roles and permissions at 381816, add/remove members at 381817, assign roles to members at 381818, and/or authorize and notify members at 381819. If only one team is managed by the administrator, the MUI may skip the second menu and jump immediately to the third menu.

[00495] On selecting define roles and permissions at 381816 the MUI transitions the user interface to an execution menu presenting options to configure each role in the system on a module-by-module basis based on all of the modules available in the analytical computing system as pre-configured in system content. On selecting add/remove members at 381817 the MUI transitions the user interface to an execution menu presenting the collection of usernames identified as members of the team, as well as, the open seats available for new members, enabling a team administrator to enter new member usernames to add members if there are open seats and/or remove existing members using services on the cloud platform to update account team configuration on each request updating the open seats available. On selecting assign roles to members at 381818 the MUI transitions the user interface to an execution menu presenting collection of members with the ability to turn on or off each role available for the account member by member, each member may have one or more roles with the corresponding permissions module-by-module, using services on the cloud platform to update account team configuration on each request. On selecting authorize and notify members at 381819 the MUI transitions the user interface to an execution menu presenting a synopsis of all members and their assigned roles with

a authorize and notify option to notify new members of being added to a team if any and/or informing existing members of changes to their assigned role(s) if any.

[00496] In FIG. 38C is an embodiment of a user experience flow through logging in to use any admin or user application in the analytical computing system beginning with login at 381801 with each step through the login user interface numbered sequentially 2 through 'n' to represent the stepwise flow from begin (1) to end ('n') for any user as depicted in login at 381801 being labelled "1." as the first step of login, also, as a user works through the flow of logging in they could easily back track to one or more previous steps. The user experience flow of FIG. 38C may be managed by a MUI, as discussed herein. At 381801 a user is first presented an option to enter a unique username at 381802 as either an email address, a user-provided name, or a system-provided name. On entering or selecting a username the username can be checked through a service request to the cloud platform to confirm this is a known username and on confirmation of being a known username transitioning to password at 381803 for the user to provide the secure password associated with the unique username that uniquely confirms authenticity of a user logging in, passing username and password through a service request on the cloud platform to provide authentication. On proper authentication a user is permitted to use the application they wish to use. When authentication is not possible, an error message is presented to inform the user they were not granted access. Optionally at 381804 it may be required of a user to provide two-factor authentication (2FA) credentials to further secure access to the analytical computing system because an account admin has configured this security feature on for the account they administer. If 2FA is configured on for an account, a user logging in the first time would have to perform a setup function at 381805 typically, but not limited to, a user scanning a barcode or typing a code provided in 2FA setup at 381805 into a separate 2FA application running on another computing device, mobile or otherwise, that synchronizes the user's use of an account with the separate 2FA application to provide another unique, independent credential to further confirm the user is as logged in. Completing setup at 381805 causes transition to enter code at 381806 for a user to use the separate 2FA application to produce a one-time unique code for them to enter into login for the code to be passed through a service request on the cloud platform to perform the final authentication of the user logging in, on success granted access and on failure getting an error message informing a user the access is not granted. At 381807, the user may be allowed to proceed, for example, choose account and/or team.

[00497] In further embodiments, the admin console module 371701 can be used to create, modify, and/or delete teams and/or accounts; add, remove, and modify individuals users within teams and/or accounts; and set, modify, and/or remove permissions for one or more individual users, teams, instruments, and/or accounts. Once these administrative procedures have been carried out (e.g., by one or more administrators), notifications and/or instructions can be transmitted to one or more of the users, accounts, and/or teams, for example, via electronic mail or through the cloud. In certain embodiments, users, accounts, and/or teams can receive these notifications and/or instructions through a uniquely assigned email address.

[00498] Referring specifically to FIG. 38D, in certain embodiments, first portion 381821 can include a first menu of user-selectable choices, including one or more of the following choices: Prepare Teams Define Administrators and Manage teams (i.e., a first set of choices). In another embodiment (not shown), first portion 381821 can include a first menu of user-selectable choices, including a Define Roles and Permissions choice; an Add/Remove Members choice; and Assign Members to Roles choice; and an Authorize and Inform Members choice, i.e., a second set of choices. Certain features and/or particular embodiments of these choices are described in additional detail in conjunction with FIGS. 38A and 38B, above.

[00499] One feature of the admin console module allows users to prepare and define teams. For example, regarding the first menu, in response to a selection of the Prepare Teams choice, the second menu of user-selectable choices includes one or more previously added teams. Previously defined teams can be viewed in this aspect and additional teams can be created and/or defined. Teams can be defined, and permissions can be assigned, based on role, experiment type, user, etc. The previously added teams may have been added by the same user, e.g., an administrator, or by other users who have access to the admin console module, e.g., with appropriate permissions.

[00500] In addition to displaying previously added teams, in response to a selection of the Prepare Teams choice, the second menu of user-selectable choices is adapted to receive one or more new teams to add among the one or more previously added team. These new members can be added, for example, by a user manually entering the information into the MUI through an input device, such as a keyboard, touchscreen, etc. Further, new teams can be added through an automated process, such as with a barcode reader, or an input file that contains a list of one or more of the new teams the user wishes to add. In one example, the team name can be preassigned.

[00501] Once teams have been added, in response to the Prepare Teams choice, the user can add, modify, remove, or otherwise define certain aspects of one or more of the teams. Referring specifically to FIG. 38H, for example, in response to the Prepare Teams choice, the first portion 381821 can be adapted to display the previously entered teams in a second menu of user-selectable choices. In the embodiment provided in this figure, the user has selected Team3, as designated by the choice being represented by all capital letters, although a user's selection can be depicted in other manners, for example, any of those described herein for displaying a particular choice in a more predominate fashion as described in greater detail above. In this embodiment, the second portion 381830 is adapted to display one or more of a number of available teams defined, a number of available seats assigned, a total number of available teams, and a total number of available seats as additional information. In the embodiment shown in this figure, this may be displayed as Team Availability Information 381831. Although particular numbers of teams defined, total teams, seats assigned, and total seats are depicted in this embodiment, other examples, e.g., totals, are contemplated as well. As users add, modify, and/or remove teams and seats, the numbers provided in the Team Availability Information 381831 will vary accordingly and will be updated as such. Further, certain users, e.g., an administrator, can override and/or change the totals defined.

[00502] The example in FIG. 38H shows first menu 381829 having been moved from the first portion 381821 to the second portion 381830 as a previous menu. In this embodiment, the first menu 381829 illustrates the first set of choices, with the "Prepare" choice highlighted as past-selected. In response to a user's selection of the "Define" choice within the first menu (which, in this example, equates to the Define Administrators item from the first menu when the first menu was displayed in the first portion 381821), a second menu of user-selectable choices of usernames and/or e-mail addresses for defining administrators may be displayed in the first portion 381821. Further, the usernames and/or email addresses displayed are adapted to be deleted from the second menu of user-selectable choices in response to a user's deletion input. Moreover, in response to the Define Administrators choice, the second menu of user-selectable choices is adapted to receive new usernames and/or email address to add among the previously added usernames and/or email addresses. These aspects, e.g., the adding, deleting, user's deletion inputs, etc. for usernames and/or email addresses, are described in greater detail below, e.g., in conjunction with Add/Remove Member choice.

[00503] In an embodiment, in response to a selection of the Define Administrators choice, a menu of the one or more previously added teams, e.g., Team1, Team2, Team3, may be displayed in either the first portion 381821 or the second portion 381830. In this example, the previously added usernames and/or email addresses can be associated with a particular team among the one or more previously added teams from that menu of choices. Further, in response to the Define Administrator choice, the first portion is adapted to display an execution menu having an Authorize and Email choice. With this feature, authorizations and/or team-assignment information is adapted to be transmitted to the previously added email addresses in response to a selection of the Authorize and Email Install Instructions choice. This Authorize and Email choice is described in greater detail below in conjunction with FIG. 38G, e.g., as applied to the Authorization Summary 381828 described below. Just as the Authorization Summary 381828 relates to providing authorization, instructions, and/or notification vis-à-vis user's defined roles, the Authorization Email choice described in conjunction with the Define Administrators features relates to authorization, instructions, and/or notification of teams and administrator functions. By utilizing the Define Administrators feature, users can establish and/or create teams based on particular users, account, etc., so that groups of individuals can work collaboratively and/or cohesively as a team,

[00504] In response to a selection of, for example, a particular team from the second menu and a specific action from a third menu, the first portion 381821 can be adapted to display two or more subsections of user-selectable choices, e.g., from successive hierarchical menus. Regarding the multiple subsection embodiments, as illustrated in FIG. 38E, three subsections can be displayed in the first portion 381821, including first subsection 381824, second subsection 381825, and third subsection 381826, respectively. In certain embodiments, the user-selectable choices available in these subsections will depend upon the section from the first menu, e.g., the original three choices discussed previously in connection with FIG. 38D. In other embodiments, the choices are static, so that the user can be presented with the same choices no matter which choice was previously selected. In the example shown in FIG. 38E, the choices available are successive hierarchical levels below the first menu, in which many teams may have been selected, the second menu, in which a particular team was selected, and a third menu, in which define roles/permissions was selected. Although three subsections are depicted in this example, fewer or greater numbers of subsections of user-selectable choices can be adapted to be displayed as well. Further, their display configuration is not necessarily limited to the horizontal arrangement illustrated in is figure, as

other configuration, such as those provided by way of example herein, e.g., vertical, concentric, etc., are contemplated as well.

[00505] In response to the user-selectable choices available in the multiple subsections, the user-selectable choices displayed in one or more of the other subsections can change depending on the previous selection. Specifically, one feature of the admin console is to define roles of individual users and/or teams, and to assign permissions to those one or more users and or teams. Teams can be formed, and permissions can be assigned based on role, experiment type, user, etc. These actions can be performed through the Define Roles and Permissions menu. For example, in response to a selection of the Define Roles and Permissions choice, the first subsection 381824 of user-selectable choices can include one or more of the following choices: Lab Manager, Designer, Associate, Operator (Base), and Maintenance Tech (Base). In this particular embodiment, if the user selects the one or more of the Lab Manager, Designer, or Associate choices, the second subsection 381825 of user-selectable choices can include one or more of the following choices: Analysis Method, Assay Method, Experiment, Assay Engine, Audit Trail, Maintenance, Reader, and System.

[00506] In contrast, if the user selects the one or more of the Operator (Base), and Maintenance Tech (Base) choices, the second subsection 381825 of user-selectable choices can include one or more of the following choices: Assay Engine, Audit Trail, Maintenance, Reader, System. User-selectable options displayed in the third, fourth, etc. subsections can further depend on the choices made from choices previously made from one or more of the of the other subsections. For example, in response to a selection of an Analysis Method choice from the second subsection 381825, the third subsection 381826 of user-selectable choices can include a Run Analysis Method choice. Similarly, in response to a selection of the Assay Method choice from the second subsection 381825, the third subsection 381826 of user-selectable choices can include a Run Assay Method choice. Still further, in other examples, the third subsection 381826 can include multiple user-selectable choices. By way of example, in response to a selection of the Experiment choice from the second subsection 381825, the third subsection 381826 can include the following choices: Create Experiment, Edit Layout, Exclude/Include Data Points, Export Data Table, Export Sample Result Table, and View Experiment. Additional exemplary, non-limiting embodiments are presented below.

[00507] In response to a selection of the Assay Engine choice from the second subsection 381825, the third subsection 381826 can include the following choices: Export Data Table; Modify Instrument Settings; Override Mesoscale Diagnostics Kit Lot Assignment; Retry Inventory Validation; Run Instrument; and Show ECL for Unverified Run. In response to a selection of the Audit Trail choice from the second subsection 381825, the third subsection 381826 can include a View Audit Trail App choice. In response to a selection of the Maintenance choice from the second subsection 381825, the third subsection 381826 can include the following choices: Run Maintenance; Run Maintenance Method; and View Maintenance Records. In response to a selection of the Reader choice from the second subsection 381825, the third subsection 381826 can include the following choices: Manage Database; Modify Instrument Settings; and Run Instrument. In response to a selection of the System choice from the second subsection 381825, the third subsection 381826 can include the following choices: Modify System Settings; and Unlock App Locked by Any User. The foregoing examples are non-limiting, as other user-selectable choices can be made available for display as well through the multiple subsections of the first portion. In some embodiments, one or more of the subsections and/or user-selectable choices within the one or more subsections can be user-customizable, e.g., by an administrator, team leader and/or member, user with permission, etc.

[00508] Another feature of the admin console module is to add and/or remove members, such as from a team or other grouping of one or more users and/or accounts. Teams can be formed, and permissions can be assigned, based on role, experiment type, user, etc. These actions can be performed through the Add/Remove Members choice. For example, in response to a selection of the Add/Remove Members choice, a first or second portion of the MUI (FIG. 38H, 381830) displays a menu including previously added usernames and/or email addresses. These previously added usernames and/or email addresses could have been added by the same user or by other users who have access to the admin console module. In an embodiment, the usernames and/or email addresses can be modified or deleted in response to a user's deletion input, assuming the user accessing them has the appropriate permissions, either by overwriting the previously entered information or by making a selection, e.g., clicking a portion of the MUI display 206, such as an "x", to remove the username and/or email address entirely. In other embodiments, any user logged into the admin console module can modify or delete the usernames and/or email addresses regardless of permissions. The previously added usernames and/or email addresses, and the ones

that have been modified can then later be associated with particular teams, accounts, instruments, etc. through the admin console module.

[00509] Turning to the embodiment depicted in FIG. 38F, in response to user's deletion input (as described above), the first portion 381821 is adapted to display a confirmation choice 381827 before removing one or more the users and/or teams. A similar confirmation choice is described below in conjunction with the reader module (e.g., FIG. 43F) for issuing a stop instrument command. In the context of the admin console module, a similar confirmation process can be employed with regard to deleting one or more the users and/or teams. The confirmation choice (FIG. 38F, 381827) can be adapted to be displayed to provide one or more users with the ability to confirm whether they want to delete the current user from a particular team, account, roles, etc. When this Confirmation choice 381827 is displayed, the user can be presented with a choice as to whether he wishes to delete the selected user, for this example the user is represented by the user@email.com email address. In this example, the user can either select "Cancel" from the menu, thereby terminating the decision to remove this member, or select "OK," thereby removing the member. These options are merely exemplary as other choices and/or command prompts are contemplated as well.

[00510] In addition to deleting and modifying members, in response to the Add/Remove Members choice at a third menu, the first portion 381821 may be configured to display an execution menu for receiving new usernames and/or email addresses to add among the previously added usernames and/or email addresses. These new members can be added, for example, by a user manually entering the information into the MUI display 206 through an input device, such as a keyboard, touchscreen, etc. Further, new members can be added through an automated process, such as with a barcode reader, or an input file that contains a list of one or more of the new members the user wishes to add.

[00511] Another feature of the admin console module is to assign members to roles, e.g., based on title, responsibility, application performed, etc. These actions can be performed through the Assign Members to Roles choice at a third menu. For example, in response to a selection of this choice, an execution menu of user-selectable items may include previously added usernames and/or email addresses displayed in a first subsection 381824. These previously added usernames and/or email addresses can, for example, be displayed in a similar manner as to those described in conjunction with the Add/Remove Members choice, above. In response to Assign Members to

Roles choice, the second subsection 381825 can include one or more of the following role-assignment choices: Lab Manager, Designer, Associate, Operator (Base), and Maintenance Tech (Base). These are merely exemplary and additional and/or hybrid roles can be included in addition to or in place of these particular roles. In one embodiment, in response to selecting the Assign Members to Roles choice, first subsection, FIG. 38E, 381824, can include the previously entered username and/or email address, and second subsection, FIG. 38E, 381825, can include the role-assignment choices, such as the five provided above. In this embodiment, a one-to-one correspondence can be displayed between the username and/or email address and its respective role assignments. In this regard, selections from the first and second subsections (FIG. 38E, 381824 and 381825, respectively) are adapted to create an association among one or more of the previously added usernames and/or email addresses with one or more of the role-assignment choices. For example, if the user selects a first username, the second subsection (FIG. 38E, 381825) can display all the roles that particular user is currently assigned. Additionally, the second subsection (FIG. 38E, 381825) can display additional roles for which that particular user is not currently assigned. This is described in greater detail below in conjunction with FIG. 38G.

[00512] Whether the user is designated to a particular role can, for example, be displayed through an indicator associated with each role to indicate whether the user is assigned (or not assigned) to that particular role. The indicator can include, for example, a checkbox, although other indicators are contemplated as well, such as text-based indicators, e.g., an “x,” “1,” “0,” etc. In the checkbox embodiment, a box can be displayed as unchecked if that user is not currently assigned that that particular role, and the box can be checked, or otherwise marked in some fashion, if that user is currently assigned to that particular role. The marking or checking can occur, for example, by a user’s input, e.g., mouse click, touchscreen, etc. In this example, the user accessing the admin console module can select and deselect one or more role assignments, by adding, removing, etc. roles to be associated with the given user, through the interaction with the MUI display 206. Notably, the marking or checking selection process described with regard to this particular aspect of the admin console module can be applied to other selections from within this module, or any other module and/or user-selectable choices described herein.

[00513] Another feature of the admin console module is to authorize user-specific roles and inform those users of the roles for which they have been assigned. These actions can be performed through the Authorize and Inform choice. As described in greater detail in conjunction with FIG.

38E, an association among one or more of the users, e.g., by way of their usernames and/or email addresses, can be created with one or more of the role-assignment choices. In one embodiment, the association of one or more these users to their one or more roles can be displayed in response to a selection of the Authorize and Inform choice. Turning to the embodiment depicted in FIG. 38G, an Authorization Summary 381828 can be displayed, for example, in the first portion of the MUI display 206) in response to the Authorize and Inform choice, such that a table is created, although other structures and/or formats are contemplated as well, that summarizes those assignments. In this embodiment, two columns are created, e.g., a User column and a Roles column, although other additional columns are contemplated as well, that provide a one-to-one correspondence of user to assigned role, although other correspondences are contemplated as well. The rows depicted in this example each represent an individual user, although teams, accounts, etc. could be included as well. Additionally, the Authorization Summary 381828 is adapted to display an Authorize and Email Install Instructions choice, located at the lower portion of the Authorization Summary 381828, although it is not limited to this embodiment. In response to a user's selection of the Authorize and Email Install Instructions choice, the role-assignment information and/or instructions are adapted to be transmitted to the previously added email addresses, or alternatively through the cloud. Thus, by selecting the transmit Authorize and Email Install Instructions choice, the user can inform one or more of the users of the role or roles for which they have been selected, and/or provide those users with information and instructions as it relates to their assigned roles.

[00514] Accordingly, an Admin Console MUI provides an operator with a wide array of access control abilities, e.g., by using teams, individual user permissions, role assignments, specific permissions, and other functionality. The Admin Console is not specific to a laboratory setting and may be applied for adjusting user permissions in further settings such as manufacturing settings, parental controls over computer and media use, and others.

[00515] In a particular embodiment, in response to a user's selection of the advanced context menu selector 381822 (FIG. 38D), the advanced context menu 381832 (FIG. 38I) can be outputted to the MUI display 206. The advanced context menu 381832 may include various commands and/or user-selectable choices. For example, with specific reference to FIG. 38I, this menu can include an Resend Install Instructions command 381833. This command, when selected, will resend installation instructions, e.g., to install the application that runs one or more of the modules

as described herein, to one or more selected users, including the user who selected this command. Those instructions can be transmitted via electronic mail, e.g., to the users' email addresses, or over the cloud. The Import command 381834, when selected allow the users to import names and/or email addresses of users, account information, team information, etc. without the need to manually input that information. Further the Change Team Name command 381835 and Change Account Name command can be used to allow the user to change the team or account, respectively, for one or more users, accounts, and/or teams. Finally, the Change Password command 381837 allows the user to change the password for her account. In other embodiments, depending on permissions, this command will allow a user, such as an administrator, to change the password of one or more additional users as well.

[00516] In FIG. 39A is an embodiment of a user experience flow through an admin audit trail module beginning with administrator app at 391900 running on an admin's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for an admin as depicted in administrator app at 391900 being labelled "1." as the first step, also, as an admin works through the flow of a user interface they could easily back track to one or more previous steps. The user experience flow of FIG. 39A may employ a MUI for interface purposes as discussed herein. At 391901 an admin can select a module to access. In this illustration, an admin audit trail module is selected, and the MUI transitions the application to start at 391902 providing an admin a first menu including options to view all admin events at 391903, view account admin events at 391904, or view team-specific events at 391905. On selection of an option the MUI transitions to a selected second menu at 391903, 391904, or 391905. At 391903 only an account admin is presented all events captured across the entire account including, but not limited to, account and team-specific actions taken by every admin with each event including, but not limited to, username of originator, date and timestamp, the source, and information pertaining the event as returned from a service request made via the cloud platform. At 391904 only an account admin is presented all account admin events captured across the entire account including only overall account admin events for account actions taken by every admin with each event including but not limited to username of originator, date and timestamp, the source, and information pertaining the event as returned from a service request made via the cloud platform. At 391905 either an account admin or a team admin is presented all team-specific events captured for each team one team at a time for which an admin has administrative rights including

team-specific administrative actions taken by every team-specific admin and account admin with each event including but not limited to username of originator, date and timestamp, the source, and information pertaining to the event as returned from a service request made via the cloud platform, wherein, an admin could easily transition to view other team-specific events without leaving the view at 391905. The menus at 391903, 391904, and 391905 each enable a user to sort the view in forward or reverse ordering by username, date and timestamp, source, or information about the event. The menus at 391903, 391904, or 391905 each allow an admin to access an execution menu permitting export of the entire collection of events provided at 391903, 391904, or 391905 to a file format easily importable to other computer applications like Excel, Word, and/or any other computer application, such as, CSV, tab-delimited text, JSON, XML, and/or any other format. At 391903, 391904, or 391905 an admin may use an execution menu to export the entire collection of events provided at 391903, 391904, or 391905 to a computer operating system mechanism used for copying and pasting content from one computer application to another computer application often referred to as a clipboard. Based on the execution menu selection, appropriate event export function (e.g., 391906, 391907, 391908) can be executed for exporting the event or events. At interfaces 5 (e.g., 5a, 5b, 5c) the information and/or data related to the events specified at interfaces 4 (e.g., 4a, 4b, 4c) can be exported. For example, in 391906, all the events from interface 4a can be exported. Similarly, in 391907 and 391908, account events and team-specific events can be exported, respectively. This exportation can be provided in a user-readable format or in a file format easily importable to other computer applications such as, without limitation, Excel, Word, and/or any other computer application, such as, CSV, tab-delimited text, JSON, XML, and/or any other format.

[00517] Further examples of the audit trail feature are disclosed with respect to FIGS. 39B-39E. The audit trail module can be adapted to provide a summary of information as it relates to one or more users' and/or teams' interactions with the UI display specifically, or more generally based on actions that users have performed while logged into their accounts. For example, the audit trail module can include the usernames and/or email addresses of the users that have logged in to an account, the time of each login, the IP address of the computing device from which the users accessed their account, which instruments the users used while logged in, etc.

[00518] In one embodiment, as shown in FIG. 39B, the audit trail module can be accessed through the advanced context selector 381822 as part of the advanced context menu 381832. In

this example, the advanced context menu 381832 is adapted to be displayed in response to a selection of an advanced context selector 381822 when outputted to the UI display 381823. When displayed, advanced context menu 381832 can include a plurality of commands and/or user-selectable choices arranged in a menu that may take the form of various configurations, e.g., vertically, horizontally, etc. In addition, one or more menu dividers 391910 can be employed to group and/or divide particular commands and/or choices. For example, the menu divider 391911 can be used to group commands on one portion of the advanced context menu 381832 and user-selectable choices on the other. In other embodiments, one or more of these dividers can be used to group and/or divide according to other attributes or traits of the menu items. In some embodiments, the location, grouping, and/or division of the menu items can be user-customizable. Advanced context selector 381822 is described in greater detail above, thus, details are omitted here aside from examples and/or embodiments provided below as they relate to the audit trail module feature.

[00519] In a particular embodiment, in response to a user's selection of the advanced context selector 381822, the advanced context menu 381832 can be outputted to the MUI display 206, e.g., by the menu manager 1054. The advanced context menu 381832 can include various commands and/or user-selectable choices. For example, with specific reference to FIG. 39C, this menu can include an export command 391911, or a command to copy data to a clipboard (not shown). It further can include user-selectable choices including an admin console choice 391912, which, when selected, can allow a user to access the admin console module, as described in greater detail above in conjunction with that module, or an admin audit trail choice 391913, which, when selected, will allow a user to access the audit trail module described herein. Other commands and/or user-selectable choices are available to users as well in the advanced context menu 381832, for example, and with reference to FIG. 39C, Terms of Use 391914, Privacy Policy 391915, and a command to log the users out of their accounts, e.g., Log Out command 391916. Although the advanced context selector 381822 is depicted in FIG. 39B near the top left portion of MUI display 206, with the advanced context menu 381832 directly below it, other configurations are contemplated as well.

[00520] With specific reference to FIGS. 39C and 39D, in response to a selection of Admin Audit Trail choice 391913, the first portion 391920 of the MUI 206 is adapted to display audit information 391917, divided into one or more fields 391918. The audit information 391917 can be arranged as a table, or in the alternative, as a list, or any other suitable arrangement of data. The

embodiment illustrated by FIG. 39D depicts the displayed audit information 391917 as including fields 391918 as the columns of a table, with each entry provided vertically in rows. Fields 391918 of audit information 391917 can include, for example, one or more of a timestamp, a username and/or email address, module, record ID, type, message, category, code, and IP address of a user.

[00521] The timestamp can include when (e.g., date and/or time) the audit was generated. In one example, this field can be presented in MM/dd/yyyy HH:mm:ss format, although other formats are contemplated as well, including those that convey more or less information than this particular format (e.g., just recording the date, but not the time). The timestamp can also record each instance a particular user logged into her account, how long she was logged into for, and when she logged out. This information can be tracked by either the username, email address, and/or any other user, team, and/or account indicator. For example, the Username field will record the username of the user that was logged in when the event was generated. The module field can include the module that generated the audit event, e.g., Reader, Experiment, etc. In this manner, this field can be populated with one or more of the modules that were utilized during that particular log-in instance. For example, if a user utilized the Assay Method and Experiment modules, this field would indicate the same. In some embodiments, multiple modules can be displayed on a single row for that particular log-in instance, and in other embodiments, audit information 391917 can be arranged across multiple rows, one for each module that particular user utilized while logged in.

[00522] The Record ID field may be included to show the ID of the record associated with the audit event. By way of example, if an experiment relates to the use of plates, the Record ID can include the plate barcode. It further can include information as it relates to the what experiments, assays, and/or functions a particular user performed while logged in, more generally. For example, it can include the file name, either default or user-customizable, associated with a particular experiment. In other examples, it can include information relating to actions performed while analyzing and assay plate, such the plate's loading, reading, ejection, etc. The Type field can include the type of audit event including, for example, Info, Action, Warning, or Error. This field can relate to other information summarized in the audit information 391917, for example, whether the user received a warning and/or an error while logged in. Or it can include additional information related to the users' actions and/or interactions with the application, equipment, and/or experiments. Further, it can convey that an analysis was performed manually or automatically, etc. The Message field can include one or more of a static, dynamic, and/or user-customizable

message that relates to the audit event. A separate field is provided for the category, e.g., Category field, of the audit event, e.g., record, system, equipment, etc. In one example, the Category field provide additional characterizations of the messages provided in the Message field.

[00523] Further, the IP Address field can provide the IP address of the computing device, e.g., laptop, desktop, tablet, etc., from which the users accessed their account, which instruments the users used while logged in, etc. The Code field can be related to the IP Address in some embodiments, or unrelated in others, whereby a unique numerical value, such as an integer, for identifying the event. In some embodiments, this identifier can be predetermined. In other examples, they can be user-defined, such as by an administrator. In the latter example, the Code field can be customized to accommodate one or more users' specific needs. Additional fields such as permissions, team identifiers, etc. are contemplated as well. Thus, the audit information 391917 can be arranged in such a manner that associates one or more of these fields to provide a trail of information that summarizes the tasks, equipment, and/or instruments associated with one or more users' experiences while logged into their accounts.

[00524] In several embodiments, the amount of information displayed can vary depending on the user's preferences. For example, a user can filter the audit information 391917 such that the information limited to one or more users, accounts, and/or teams, e.g., previously added teams by utilizing the Admin Console module as described above. An example of this is depicted in the embodiment shown in FIG. 39D. An audit menu 391919 can be outputted to MUI display 206, shown here by way of example in the second portion 391921 of MUI display 206, that can be used to filter this information. In this embodiment, a user has selected to filter the audit information 391917 by team, which is illustrated by depicting the "Team1" selection in all capital letters in this particular embodiment, although a user's selection can be depicted in other manners, for example, any of those described throughout for displaying a particular choice in a more predominate fashion as described in greater detail herein. In this example, only User1 and User4 are members of this particular team (i.e., Team1), and, thus, the audit information 391917 has been filtered by the that team. In other embodiments, all audit information can be made available for display, or user can narrow the audit information to be displayed by one or more users, accounts, teams, and/or instruments. In one example, the audit menu 391919 can be outputted to MUI display 206 in response to a command to display an audit menu 391919 by selecting the Admin Audit Trail choice.

[00525] In addition to being displayed by the MUI display 206, the audit information 391917 can be copied and/or exported. For example, in response to an export command 391911 (FIG. 39C), the audit information 391917 can be outputted to an export file, such as a Microsoft Excel® or other data processing and/or spreadsheet software. Alternatively, it can be provided in a comma-separated file, e.g., CSV file. In response to the export command 391911, the requested file containing audit information 391917 can be exported to a user, either by the user selecting and/or viewing the exported file. Alternatively, it can be exported by emailing it to the user and/or transmitting it over the cloud. Further, in response to the copy to clipboard command (e.g., as depicted within the advanced context menu 381832 as shown FIG. 39B), all or a subset of the data including the audit information 391917 can be temporarily stored to a buffer, such that the user can later access and/or view it (e.g., using a cut-and-paste command). In this example, the user is not confined to the formats for which the data are presented in the exported file, providing users with the ability to customize the data format and/or utilize one or more applications of their choice to access, modify, and delete those data.

[00526] In FIG. 40 is an embodiment of software modules in an analytical user app 402000 forming the primary user interface experience for analytical work typically, but not limited to, using data generated through the use of instrumentation with each module using services provided by cloud platform 402006 to create, read, update, and/or delete any and all data relevant to each module's processing, as well as any other services needed for each module's processing, wherein experiment module 402001 would be the active module by default when the analytical user app 402000 starts. As discussed above, the analytical user app 402000 may employ a MUI supplied by a methodical user interface control system 1102 for interface purposes. The experiment module 402001, assay method module 402002, analysis method module 402003, audit trail module 402004, and the system functions 402005 may all employ a MUI for user interface purposes. An analysis method module 402003 provides a construct referred to as an analysis method to be used in post-read analysis of signal collected from a test plate by a plate reader, wherein an analysis method is used to configure an existing process and/or create a new process by which data collected from tested samples using instrumentation and/or consumables can be transformed through an algorithm configured by associated parameters into a quantitative or qualitative determination. Assay method module 402002 is used to configure an existing process and/or create a new process by which samples will be processed using consumables and/or instrumentation to generate data

from the samples under test so they may be appropriately analyzed using a prescribed analysis method. Experiment module 402001 is used to design a test of one or more samples using one or more selected assay method(s) to collect the data from the samples through the use of instrumentation and/or consumables that may be reviewed and analyzed to ensure the experiment ran properly, as well as to learn from the data collected from the tested samples. Audit trail module 402004 is used to view all events generated through use of the analytical computing system by users from the same team who are creating, modifying, and/or deleting electronic records associated with the analytical computing system. The collection of system functions 402005 provides typical utilities in support of use of the system such as, but not limited to, logging off, viewing help information, viewing user guide, viewing legal notices and/or documents, changing software configuration, changing user password, and/or other utilities. The collection of system function 402005 may be provided as a separate MUI module and/or a series of software protocols that operate alongside the other discussed MUI modules. A user can log into the analytical user app 402000 through system functions 402005 using services provided by cloud platform 402006. If authentication of a user by login service on cloud platform 402005 the service returns that a user has more than one account and/or team, a user will be required to select the default account and/or team, but if a user does not belong to more than one account and/or team, the service on the cloud platform 402006 would auto-assign a user to the sole account and team for that user. On completing login, the user lands at start of the experiment module 402001 and begins using the analytical user app 402000 as they need. In the alternative, the analytical user app 402000 can assist in performing other experiments in addition to or in place of the assay and/or plate-based experiments described herein.

[00527] In FIG. 41 is an embodiment of a user experience flow through an analysis method module beginning with analytical user app at 412100 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in analytical user app at 412100 being labelled "1." as the first step. The experience flow of FIG. 41 may be provided via a MUI as discussed herein. At some point in the flow a user could have alternate flows based on a decision they are to make as denoted by a lowercase letter after a numbered step as depicted at 412112, 412113, and 412114 where a user chooses between configuring calibration curve at 412112, background correction at 412113, and/or limits of detection at 412114, also as a user works through the flow of a user

interface they could easily back track to one or more previous steps through the use of an historical portion of the MUI. At 412101 a user may select a user interface mechanism presenting one or more options including, but not limited to, module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option, in this case choosing analysis method module and transitioning the application to start at 412102. At 412103 a user is presented one option to design an analysis method and a user on choosing to do so transitions to design at 412104. At 412104 a first menu is presented, allowing the user to select between menu items analysis method 412105, calibration curve 412112, background correction 412113, limits of detection 412114, and confirm 412115. Upon selecting analysis method at 412105 a second menu is presented including options to select from recent analysis methods at 412106 or available analysis methods at 412107. A default may be recent analysis method at 412106. The MUI may auto-transition to all analysis methods at 412109 if recent analysis methods at 412106 is empty. At 412106, on selection of recent analysis methods, a user is presented a configurable amount, for example twenty five, of the most recently used analysis methods at 412108 as returned from a service request made via the cloud platform. Alternatively, selection of available at 412107 presents to a user a new execution menu of all analysis methods at 412109 as returned from a service request made via the cloud platform with the analysis methods organized by system-provided default analysis methods and user-provided analysis methods, enabling a user to browse the various analysis methods and to select the analysis method of choice. On selection of an analysis method at the execution menus 412108 or 412109 the user interface returns to the first menu at 412104, presenting the options of configuring calibration curve at 412112, background correction at 412113, and limits of detection at 412114. In embodiments, calibration curve at 412112 is the default, and the MUI is configured to walk the user through the subsequent menus 412112, 412113, and 412114 as the user executes a selection in each. On selection of calibration curve at 412112 a user is given options on the view to select an algorithm from the available set being system-provided algorithms 4PL, 5PL, Linear, Log-Log, Exponential, or any other algorithm potentially provided by the system, as well as, any user-provided algorithms.

[00528] The 4PL algorithm may be calculated as

[00529]
$$y = b_1 + \frac{b_2 + b_1}{1 + (x/b_3)^{b_4}}$$

[00530] where y is the response signal from a plate reader, x is the concentration, b1 is maximum response plateau or calculated top, b2 is minimum response plateau or calculated bottom, b3 is concentration at which 50% of the maximal response is observed or calculated mid-point, and b4 is the slope or shape parameter or calculated Hill Slope

[00531] The 5PL algorithm may be calculated as

$$[00532] \quad y = b_1 + \left(\frac{b_2 + b_1}{1 + (x/b_3)^{b_4}} \right)^{b_5}$$

[00533] where y is the response signal from a plate reader, x is the concentration, b1 is maximum response plateau or calculated top, b2 is minimum response plateau or calculated bottom, b3 is concentration at which 50% of the maximal response is observed or calculated mid-point, and b4 is the slope or shape parameter or calculated Hill Slope, and b5 is asymmetry factor or calculated asymmetry factor.

[00534] The Linear algorithm may be calculated as

$$[00535] \quad y = mx + b$$

[00536] where y is the response signal from a plate reader, x is the concentration, m is the slope or calculated Hill Slope, and b is y-axis intercept or calculated y intercept.

[00537] The Log-Log algorithm may be calculated as

$$[00538] \quad \log_{10}(y) = m(\log_{10}(x)) + b$$

[00539] where y is the response signal from a plate reader, x is the concentration, m is the slope or calculated Hill Slope, and b is y-axis intercept or calculated y intercept.

[00540] The Exponential algorithm may be calculated as

$$[00541] \quad y = ae^{bx}$$

[00542] where y is the response signal from a plate reader, x is the concentration, a is plate reader response signal at minimum response or calculated y intercept, and b is a constant describing the magnitude of increase or decrease or Hill Slope; with selection of an algorithm making it the default for the analysis method being configured.

[00543] On selection of an algorithm in calibration curve at 412112, a user may then define a weighting factor for the chosen algorithm to be used in calculations to compensate for the differences in magnitude of the residuals at low and high analyte concentrations with options $1/y^2$, $1/y$, or none; then a user may choose input signal with options to use from the calibrators the raw

input signal or the background-corrected signal; and finally a user defines to calculate replicates either individually or as an average of the replicates.

[00544] At 412113 a user is provided a view for selection of background detection configuration provides options for a user each for calibrators, controls, and unknowns (i.e., samples under test) where a user may choose to do no signal correction or in calculating a corrected signal the software would adjust the raw signal from a plate reader by subtracting or dividing it by the background count of the plate reader. At 412114 the selection of limits of detections provides options for a user in determining the limits of detection using the standard deviation of the high and low calibrators or as a percentage of the ECL counts above or below the high and low calibrators.

[00545] At 412115 selection of confirm by a user presents a user the option to use a system-provided name for the new analysis method or provide their own name and accept the new analysis method for inclusion in the set of user-provided analysis methods with any changes to the analysis method at 412112, at 412113, and/or at 412114 resulting in a service request made via the cloud platform creating a new analysis method as defined for a user's current team database and a user transitioning at 412116 back to start at 412102.

[00546] A user may also confirm at 412115 or, in any other step along the flow, reject their changes to the analysis method and return to start at 412102 not creating a new analysis method. Although these embodiments describe plate-based tests and/or experiments, the methods described herein can be applied in the alternative to the review of other experiments and tests in the alternative.

[00547] In FIG. 42A is an embodiment of a user experience flow through an assay method module focused on designing an assay method beginning with bioanalytical user app at 922200 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in bioanalytical user app at 922200 being labelled "1." as the first step. The user experience flow of FIG. 42A may be implemented via a MUI as discussed herein.

[00548] At 922201 a user may select a user interface mechanism presenting one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option, choosing assay method module. On selection of assay

method at 922201 the application transitions at 922202 to the start of the assay method module presenting at 922203 and at 922204 an option to design an assay method or review an assay method. If the user opts for design assay at 922203, the flow continues as discussed below. FIG. 42B shows the process flow after 922204 is selected. On selection of design at 922203 a user may be presented a next menu including manual assay method at 922206 and automated assay method at 922205.

[00549] Should the user select manual assay an assay method at 922206, they are presented options to select from recent assay methods at 922207 or available assay methods at 922210. The default is recent assay methods at 922207 and the MUI may autotransition to all assay methods at 922211, the recent assay methods are empty as returned from a service request made via the cloud platform. At 922207 on selection of recent assay methods, a user is presented a configurable amount, for example twenty five, of the most recently used assay methods at 922208 as returned from a service request made via the cloud platform. Alternatively, selection of available assay methods at 922210 presents to a user all assay methods at 922211 as returned from a service request made via the cloud platform. The assay methods are organized by source, such as, but not limited to an overall catalog of available assay methods, purchased consumables associated with available assay methods, and by each username those who have created new assay methods, then the consumable family that organizes assay methods based on a common use model, and then assay method name, enabling a user to efficiently browse the various assay methods and to select the assay method to base their new assay method design.

[00550] On selection of a specific assay method at either 922208 or 922211 the user interface transitions to 922213 to present the user the assay configuration on the test plate associated with the assay method as returned from a service request made via the cloud platform, wherein the user may alter the test plate and assay assignment using either purchased assays or user-provided assays to various spots in a well on the associated type of test plate, including being able to disable desired assay assignments, and on completion of edits to the assay configuration a user will select layout at 922214 storing the changes via web service(s) on the cloud platform before transitioning.

At 922214 a user is presented a graphical representation of a test plate and a visual representation of where on the test plate, i.e., which spots in which wells, various types of samples are allocated, which is key for properly processing an assay method on a test plate. In the layout menu at 922214, the user is presented items to select previously defined layout of samples on a plate at 922215 or

an edit layout function at 922223. The previously defined layout selection at 922215 provides recently used layouts at 922216 as a carousel of plates with the sample layout and layout name being a configurable set of up to but not intended to limit to 25 layouts or all available layouts at 922219. A user, may, from the select layout menu at 922215, also select to create a new layout from scratch at 922222, which advances the user to the edit layout function at 922223.

[00551] On selecting a layout at 922217 or 922220 a user transitions back to 922214 to see the selected layout. Anytime a user transitions to layout at 922214 they may edit the layout via edit layout at 922223.

[00552] On choosing to edit layout at 922223, a user is presented a collection of options of equal importance to enable a user efficiently navigating to various options requiring attention. Thus, these options may be presented as a series of concurrently adjustable menus. At 922224 a user may configure parameters associated with calibrators used in the assay method, most notably, the number of calibrators and number of replicates which dictates how many wells on the test plate will be taken up calibrators. At 922226 a user may configure parameters associated with controls used in the assay method, most notably, the number of controls and number of replicates which dictates how many wells on the test plate will be taken up controls. At 922228 a user may configure parameters associated with blanks used in the assay method representing the expectation of very low signal purposefully, most notably, the number of blanks and number of replicates which dictates how many wells on the test plate will be taken up blanks. At 922229 a user may configure parameters associated with a samples used in the assay method representing a placeholder for samples that will be tested when this assay method is used in an experiment, most notably, the number of samples and number of replicates which dictates how many wells on the test plate will be taken up samples, by default samples take up all remaining wells on the plate after accounting for calibrators and/or controls and/or blanks but a user is enabled to set a specific number at or below the maximum number of unused wells on the test plate.

[00553] On completing configuration of the various types of samples that are expected to be on a test plate for the assay method, a user at 922230 may edit the layout of the different sample types on the test plate, manipulating where wells are located by either moving rows in total and/or columns in total and/or moving individual sample types assigned to a well. A user may then select to define one or more groups at 922231 to provide one or more name groups that subdivide a test plate into one or more sub-plates each named as a user provides at 922231.

[00554] Once groups are defined at 922224, at 922226, at 922228, and at 922229 each group may have a sub-definition associated with them per the number of defined and named groups for which a user may configure or not one or more of the prescribed sampled types, with an additional capability to assign to one group the calibration curve of another group to allow sharing of calibrators across one or more groups on the plate and one more additional capability to assign blanks in one group to allow sharing of blanks across one or more groups on the plate. On completion of all of the edits under layout at 922214, a user may select a confirm option at 922232. Although this option is shown as a submenu of the edit layout function at 922232, it may also be accessible as a submenu of the layout function at 922214

[00555] At 922232 a user is presented a summary view of the layout for the assay method they have designed enabling a user to navigate to a previous steps to alter any decisions they made in the process of designing the layout and if all their decisions are in line with their expectations they would select confirm storing their layout via web service(s) to the cloud platform for future use in an experiment and on completion of the invocation of web service(s) the MUI transitions back to the assay menu at 922213, where the user may further select assay analysis methods at 922233.

[00556] At 922233 a user is presented the assignment of analysis methods to either the assay method and/or the one or more assays assigned to the assay method with the option to select a particular analysis to canvas all assays in the assay method, that on selection automatically applies the chosen analysis method to all assays in the assay method. A user may also alter the analysis method for any or all individual assays in the assay method by choosing the analysis method assigned to an assay with the user interface presenting the available system-default analysis methods as well as any user-provided analysis methods from which the user chooses the desired analysis method for the assay. A user may use this previously disclosed mechanism of analysis method selection for selecting an analysis method at the assay method level to assign the same analysis method to all assays in the assay method.

[00557] On completion of analysis method assignment at 922233 a user may select protocol configuration at 922234 with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning at 922234. At 922234 a user is presented the various parameters associated with the processing of the assay method either on a coordinated-operation instrument or manually leveraging one or more individual-operation instrument. The parameter set would be instrument specific but could include but not intended to limit to incubation

time(s), wash cycle(s), read buffer incubation(s), reagent addition(s), and/or any other step in the processing of a protocol that could be parameterized and configured. In some embodiments, an assay method may have no protocol defined for it and therefore this step may be not shown to a user for an assay method with no protocol. On completion of protocol configuration at 922234 a user may select confirm at 922235, although this is shown as a submenu of the protocol menu at 922234, it may also be accessible as a submenu of the assay menu at 922213, with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning at 922235. At the confirmation menu of 922235 a user is presented a summary view of the assay method they have designed to confirm they made all the right choices, enabling a user to navigate to a previous steps to alter any decisions they made in the process of designing the assay method and if all their decision are in line with their expectations they may select confirm storing their assay method via web service(s) to the cloud platform for future use in an experiment and on completion of the invocation of web service(s) the user interface would transition back to start at 922202.

[00558] In further embodiments, an assay method module may operate as follows. A first menu may be a design assay menu. Upon selection the design assay menu is relocated to the historical portion and a second menu is presented providing a user with an option to select a manual assay method or an automatic assay method.

[00559] Selecting manual assay method provides a third menu including recent assay methods and available assay methods as options.

[00560] Selecting recent assay method provides a third menu including names of recent assay methods. Selecting an assay name moves the assay to the historical portion and provides a new current assay design menu including "assay," "layout," "analysis method," and "confirm," menus. The assay menu provides, in sub-portions of the active portion, multiple sub-portions. A first sub-portion provides spot layout and lists of assays by spot assignment (i.e., test sites) in the selected method applied to an editable list of analytes. The first sub portion may include, test plate type on a horizontal wheel, e.g., 96 Wells 1 Small Spot, 96 Wells 1 Small Spot High Bind, 96 Wells 1 Small Spot Q, 96 Wells 1 Spot, 96 Wells 1 Spot High Bind, 96 Wells 1 Spot Q, 96 Wells 10 Spot, 96 Wells 10 Spot High Bind, 96 Wells 10 Spot Q, 96 Wells 10 Spot Q High Bind. If a 10-plex plate is chosen in the first sub-portion, then a middle sub-portion appears that lists 1-PLEX – 10-PLEX. If a 10-plex plate is not chosen, then a right-side subportion appears that lists assays, which

can be searchable depending on highlighted assay method or existence of unassigned spot position in first subportion. The layout menu provides a plate layout showing where sample types are located. The analysis menu provides a subsequent menu having subportions allowing a user to select from a first sub portion listing assays in the selected assay method and algorithm types for each assay in a second subportion. The confirm menu shows, in a first subportion a spot layout and list of assays by spot assignment in selected assay method and, in a second sub portion, assay method name, plate layout, and a confirm option.

[00561] Selecting available assay options provides a third menu showing multiple subportions. The first subportion presented the options of assays purchased from consumable manufacturer (“MSD Purchased”), available from consumable manufacturer (“MSD Catalog”), and usernames. The second subportion provides assay method types filtered by the highlighted item in first subportion: Bio-dosimetry, Custom, Custom Sandwich Immunoassay, Immunogenicity, PQ, Pharmacokinetic, N-PLEX, S-PLEX, U-PLEX, U-PLEX Dev Pack, Utility, V-PLEX, where Utility is less than an entire assay protocol performed by an automated instrument; e.g., wash, add read buffer, read; or add read buffer, read. The third sub-portion provides assay methods filtered by highlighted item in first and second subportions. After selection of an assay method via this process, a new menu is provided according to the assay design menu as described above.

[00562] If, at the second menu, the user selects automated assay method, they are provided with a choice between recent assay methods and available assay methods, as described above. The only difference in the “available assay methods” flow as compared to the recent assay methods flow is in the protocol menu, described below.

[00563] Selecting recent assay methods provides a third menu including names of recent assay methods. Selecting an assay name moves the assay to the historical portion and provides a new current assay design menu including “assay,” “layout,” “analysis method,” and “confirm,” menus similar to those described above. The assay design menu also includes a protocol menu option.

[00564] The protocol menu option provides options for a coating menu, blocking, capture, detection, detection incubation, and secondary detection incubation. The coating menu provides options in a first subportion for Enable Coating, Wash Before Coating Step, Linker Volume, Capture Antibody Volume, Stop Solution Volume, Coating Species Volume, Volume of Diluent in Capture Blend, Coupled Antibody Volume in Blend, Coating Blend Dispensed Per Well, Coupling Incubation Duration, Stopper Incubation Duration, Coating Incubation Duration, with

On/Off toggle or adapted to be editable to enter a number. The coating menu provides a second subportion that appears for editing numbers related to the first subportion. The blocking menu provides a first subportion for Enable Blocking, Wash Before Blocking Step, Blocking Volume, Blocking Incubation Duration, with On/Off toggle or adapted to be editable to enter a number. The blocking menu provides a second subportion that appears for editing numbers related to the first subportion. The capture menu provides a first subportion: Assay Volume, Wash Before Test Plate Incubation, Sample Incubation Duration, Test Plate Incubation Duration, with On/Off toggle or adapted to be editable to enter a number. The capture menu provides a second subportion that appears for editing numbers related to the first subportion. The detection menu provides a first subportion: Detect Volume, Detection Incubation Duration, with On/Off toggle or adapted to be editable to enter a number. The detection menu provides a second subportion that appears for editing numbers related to the first subportion. The detection incubation menu provides a first subportion: Wash Before Detection Step, Detection Species Volume, Detection Incubation Duration, with On/Off toggle or adapted to be editable to enter a number. The detection incubation menu provides a second subportion that appears for editing numbers related to the first subportion. The secondary detection incubation menu provides a first subportion including Enable Secondary Detection, Wash Before Secondary Detection Step, Secondary Detection Species Volume, Detection Incubation Duration, with On/Off toggle or adapted to be editable to enter a number. The secondary detection incubation menu provides a second subportion that appears for editing numbers related to the first subportion. The read buffer menu provides a first subportion: Read Buffer Volume, Read Buffer Incubation Duration, with On/Off toggle or adapted to be editable to enter a number. The read buffer menu provides a second subportion that appears for editing numbers related to the first subportion.

[00565] In FIG. 42B is an embodiment of a user experience flow through an assay method module focused on reviewing an assay method beginning with analytical user app at 422200 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in analytical user app at 421100 being labelled "1." as the first step. The experience flow of FIG. 42B may be facilitated by a MUI as discussed herein. At 422201 a user may select a user interface mechanism presenting one or more options including, but not limited to, module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or

toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a scroll-wheel menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option, choosing assay method module. On selection of assay method at 422201 the MUI transitions at 422202 to the start of the assay method module presenting a first menu including options at 422203 and at 422204 an option to design an assay method or review an assay method respectively. The illustrated workflow shows the results of a selection of 422204, to review an assay method, with the user in this case choosing to review at 422204.

[00566] On selection of review at 422204 a user is requested to choose an analysis method at 422206 from a next menu presenting options including recent assay methods at 422207 or available assay methods at 422208. The default may be recent assay method at 422207. The MUI may auto-transition to all assay methods at 422208, if recent at 422207 is empty as returned from a service request made via the cloud platform. On selection of recent assay methods at 422207, a user is presented a configurable amount, for example twenty five, of the most recently used assay methods at 422209 as returned from a service request made via the cloud platform. Alternatively, selection of available at 422208 presents to a user all assay methods at 422211 as returned from a service request made via the cloud platform. The assay methods may be organized by the source they are from, including, but not limited to, an overall catalog of available assay methods, purchased consumables associated with available assay methods, and by each username those who have created new assay methods, then the consumable family that organizes assay methods based on a common use model, and then assay method name, enabling a user to efficiently browse the various assay methods and to select the assay method to base their new assay method design. On selection of an assay method at either 422211 or 422209, the MUI transitions to 422213 to present the user a summary graphical view of the layout for a plate to be used in an experiment using the assay method's definition as returned from a service request made via the cloud platform. The display at 422213 may also be reached from the review assay method menu at 422204, where it will display a currently selected menu. Although this embodiment describes methods for performing assays and/or plate-based experiments, other experiments and tests are contemplated as well.

[00567] In FIG. 43A is an embodiment of a user experience flow through an experiment module focused on experiment design beginning with analytical user app at 432300 running on a user's

computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in logical user app at 432300 being labelled "1." The user experience flow of FIG. 43A may be managed by a MUI as discussed herein. The experiment module may be implemented via a methodical user interface control system 1102 operating as part of or in conjunction with the analytical user app 432300. The experience flow of FIG. 43A may be facilitated via a MUI as described herein.

[00568] At 432301 a user is logging into the analytical user app 432300. After the login process the user interface transitions to start at 432305 since the experiment module is envisioned in this embodiment to be the default first module after a user logs in, where now the user has a menu of three options including either 1) design an experiment at 432307, 2) review an experiment at 432308, or 3) select a user interface mechanism at 432306. The user interface mechanism at 432306 permits a user to adjust a user interface by presenting one or more options including, but not limited to, module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option. The review experiment option at 432308 provides a workflow as discussed below with respect to FIG. 43B.

[00569] In choosing to design an experiment at 432307, the MUI transitions to a second (or next) menu with the user asked to choose to design at new experiment at 432309 or use a previous experiment at 432310 on which to base the new experiment.

[00570] On selection at 432309 of a new design, the MUI transitions to a design setup menu at 432321 (discussed further below).

[00571] On selection at 432310 of an existing design, the MUI transitions to design at 432313. The design menu at 432313 asks the user to choose an experiment at 432314 with options to select from recent experiments at 432315 or available experiments at 432316. The default is recent experiments at 432315 but the MUI may auto-transition to all experiments at 432318 if recent experiments at 432315 is empty as returned from a service request made via the cloud platform. At 432315 on selection of recent experiment, a user is presented a configurable amount, for example twenty five, of the most recently ran experiments at 432317 as returned from a service request made via the cloud platform. Alternatively, selection of available at 432316 presents to a user all experiments at 432318 as returned from a service request made via the cloud platform with

the experiments organized by username and/or email address, date and time of creation, and experiment name, enabling a user to browse the various experiments and to select the experiment on which to base the new experiment.

[00572] On selection of an experiment at either 432317 or 432318 the MUI transitions back to the design menu at 432313 and auto-highlights design setup at 432321 as a next step. At 432321 a user is provided options to name an experiment starting with a unique default name provided by the system, for example but not limited to, a concatenation of username, date, and timestamp, that a user may edit, as well as choosing whether the experiment will be performed on a coordinated-operation instrument (also referred to as automation) or an individual-operation instrument(s) (also referred to as manual). On a user making their decisions at 432321 the user interface advances to assay method selection at 43232, which asks the user to choose an assay method with options to select from recent assay methods at 432323 or available assay methods at 432325. The default is recent at 432323, but the MUI may auto-transition to all assay methods at 432326 if recent at 432324 is empty as returned from a service request made via the cloud platform. At 432322 on selection of recent at 432323, a user is presented a configurable amount, for example twenty five, of the most recently used assay methods at 432324 as returned from a service request made via the cloud platform. Alternatively, selection of available at 432325 presents to a user all assay methods at 432326 as returned from a service request made via the cloud platform with the assay methods organized by the source being from but not limited to an overall catalog of available assay methods, purchased consumables associated with available assay methods, and by each username those who have created new assay methods, then the consumable family that organizes assay methods based on a common use model, and then assay method name, enabling a user to efficiently browse the various assay methods and to select the assay method to be used with the new experiment.

[00573] By default, an experiment may have assigned to it one assay method. But while choosing the assay method a user could select at 432306, the function selection (as used herein, the “function selection” menus of various embodiments refer to advanced context menus) to view an option to allow the experiment to have defined for it multiple assay methods that on selection initiates the action at 432332 to enable a user to select more than one assay method for an experiment and conversely toggle back to single assay method selection, where multiple assay method selection is used to broaden even further the assays to run against a collection of samples with the potential to limit the number of assay methods that may be selected and/or not limit the

number of assay methods that may be selected dependent on operational constraints of available instruments or arbitrary limits a user may want to place on an experiment. Once a user has completed selecting the assay methods for the experiment, the user interface is transitioned to sample definition at 432327 where the user is presented with options either to enter the number of samples to test at 432328 with the system auto-generating sample identifiers from 1 to the number of samples the user has entered limited by the sample configuration in the selected assay method(s) or to import sample definition from an import file as provided by an external system at 432329. On manual sample definition at 432328 or import of samples at 432329, the user interface transitions to the final design step of confirming the experiment is ready to process at 432330. At 432330 a user is presented with the collection of one or more plates dependent on the number of samples being processed using the one or more selected assay methods, where each plate is assigned one assay method with an assigned set of samples to be processed on the respective plate, with a user being able to view the sample assignments to plates through a function at 432333 initiated through the function selection at 432306 and on completion returning at 432330. If a user selects one assay method for an experiment then the defined samples will result in one or more plates each with the same assay method where the samples are distributed from 1 to whatever the number defined or imported resulting in however many plate-assay method pairings are required to be able to process the total set of samples defined to create a run of plates-assay methods-samples, but the number of plate-assay method pairings could be limited by the type of experiment, automated or manual, being selected in setup at 432321 dependent on physical or arbitrary constraints placed on the system. If a user selects more than one assay method for an experiment then the defined samples will be limited to the least number of samples provided for in any of the selected assay methods where the samples are distributed from 1 to the least number of samples provided for in any of the selected assay methods on each plate that has for each plate-assay method pairing based on the selected assay methods of the experiment to create a run of plates-assay methods-samples. In either the single assay method or multiple assay method experiment, the samples to test could result in more than one run of plates-assay-methods-samples; such that, there could be no limit on the number of samples a user defined for an experiment where each run of plates-assay methods-samples would be repeated to cover the complete processing of the full set of samples defined. Once a user has established the designed experiment is as expected they would select the confirm function on the user interface at 432330 that on selection creates the

experiment ready to be processed by a team through a service request made via the cloud platform and at 432331 the user interface transitions back to start at 432305. Setup components shown at 432311, 432312, 432319 and 432320 function similarly to 432321. In the alternative, the analytical user app can assist in performing other experiments in addition to or in place of the assay experiments and/or plate-based tests described herein.

[00574] In FIG. 43B is an embodiment of a user experience flow through an experiment module focused on reviewing an experiment beginning with analytical user app at 432300 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in analytical user app at 432300 being labelled "1." as the first step. The experience flow of FIG. 43B may be facilitated by a MUI as discussed herein. At 432301 is a login user step. After the login process the user interface transitions to start at 432305 since the experiment module is envisioned in this embodiment to be the default first module after a user logs in, where now the user has three options either 1) design an experiment at 432307, 2) review an experiment at 432308, or 3) select a user interface mechanism at 432306. The user interface mechanism at 432306 presents one or more options including, but not limited to, module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option.

[00575] In choosing to review an experiment at 432308, the MUI transitions the application to 432340 and presents the user with a first menu permitting a user to select review of experiments at 432341 or of specific plates at 432348. Upon selecting experiments at 432341, a next menu permitting a user to select from recent experiments at 432342 or available experiments at 432343 is presented. The default may be recent experiments at 432342 but may auto-transition to all experiments at 432345 if recent experiments at 432344 is empty as returned from a service request made via the cloud platform.

[00576] At 432342, on selection of recent experiments, a user is presented with a configurable amount, for example twenty five, of the most recently ran experiments at 432344 as returned from a service request made via the cloud platform. Alternatively, selection of available at 432343 presents to a user all experiments at 432345 as returned from a service request made via the cloud platform. The experiments may be organized by username, date and time of creation, and

experiment name, enabling a user to browse the various experiments and to select the experiment to view. On selection of an experiment either at 432344 or at 432345, the MUI transitions to review plates associated with the chosen experiment at 432348.

[00577] At 432348 a menu presents a collection of one or more plates in the order of the addition to the experiment and labeled with the assay method name assigned to the plate. Accessing the plates menu after selection of experiments serves as a filter to the plates menu, and only those plates corresponding with the selected experiment will be displayed. On selection of a plate at 432348 the MUI transitions to offer a next menu permitting a user to select from a plate data graphical view at 432349, a plate data tabular view at 432350, a plate flag tabular view at 432351, a sample menu at 432352, a calibrators menu at 432353, a controls menu at 432354, and execution menus for editing lot data function at 432355, assigning plate function at 432366, and editing layout function at 422367. Selection of 432349 causes the MUI to present the selected specific plate in the experiment with a heat map representation of signal or calculated concentration if available for all assays (or spots) in the assay method in each well of the plate, where a user may choose a particular assay to view narrowing down the data to just that one assay and a user may select a particular well to see the specific signal value for a sample in the selected well for the selected assay while being able to change the high and/or low signal or concentration range for the plate to alter the intensity of the heat map across all samples visible on the plate. In addition to viewing a heat map of a plate at 432349, a user has other options available for viewing plate data at 432350, at 432351, at 432352, at 432353, and at 432354. At 432350 a user is presented a well-by-well table view of the data presenting but not limited to sample identifier, assay, signal (log and linear), concentration (log and linear) if available, and statistics associated with the generated data. In embodiments, the columns presented in the table of data may include: Plate, Sample, Assay, Well, Spot, Dilution, Conc., Conc. Unit, Signal, Adj. Signal, Mean, Adj. Signal Mean, CV, Calc. Conc., Calc. Conc. Mean, Calc. Conc. CV, % Recovery, %Recovery Mean. Each of the data presentations at 43249-432354 may be presented in the active portion in three subportions. The first subportion may allow the user to select spots from a visual representation of a well. The second subportion may allow the user to select wells from a visual representation of a plate. The third subportion may provide data from the selected spot. At 432351 a user is optionally presented a table view of flags denoting abnormal events that may have occurred during processing of one or more plates potentially bringing the data's quality into question for a user, only available to a

user if there was at least one flag generated for a plate. At 432352 a user may select a scatter plot at 432356 of sample signal or concentration, if available, for each assay on all of the plates and may select to switch viewing signal or concentration, if available, through a toggle function at 432358 and at 432359. At 432352 a user may also select to view the data in tabular form at 432357. At 432353 a user is presented calibration curve plots one assay method at a time with one plot for each assay in the assay method if the assay method is using an analysis method that produces sample concentrations with up to five plates visible on each plot providing a user interface mechanism to enable a user to change the five visible plates if there are more than five plates. The user may further select the option at 432360 to change the assay method for which to view the calibration curves and additionally select the option to drill down on a particular assay calibration curve plot at 432362 to expand that plot to see its one or more plates of visible data. Also provided is a mechanism to view a small table of signal and concentration data for one or more selected points on a curve including excluding calibrator points if a calibrator appears to have an abnormal response, as well as to select the group to view on each plate if the assay method for the viewed assay has defined for it more than one group on its plate layout. At 432354 a user is presented percent recovery plots of controls one assay method at a time with one plot for each assay in the assay method if the assay method is using an analysis method that produces sample concentrations with up to five plates visible on each plot providing a user interface mechanism to enable a user to change the five visible plates if there are more than five plates. The user is further given the option at 432363 to change the assay method for which to view the percent recovery plots and additionally providing the option to drill down on a particular assay percent recovery plot at 432365 to expand that plot to see its one or more plates of visible data, while also providing a mechanism to select the group to view on each plate if the assay method for the viewed assay has defined for it more than one group on its plate layout.

[00578] Execute menus provided at 432355 to edit provided lot-specific data associated with calibrators and/or controls, at 432356 to assign a plate manually in an experiment when the processing of an experiment cannot automatically assign processed plates to the experiment, and at 432357 to edit the layout for a specific plate being viewed in the case where a user needs to make a correction to a layout for an experiment. Supplemental functions not depicted in FIG. 43B include but are not limited to exporting various tables and/or charts for import into other software applications and copying various charts to be pasted into other software applications.

[00579] In an alternative, the analytical user app can assist in reviewing other experiments in addition to or in place of the assay experiments and/or plate-based tests described herein. Interface 12 at 432341 provides an interface that displays possible experiments associated with the analytical user app. Further, interface 14a at 432344, interface 16 at 432348 provides a visual representation of the plates associated with the experiments at interface 432344. Similarly, following interface 14b at 432345, interface 16 at 432348 provides a visual representation of the plates associated with the experiments at interface 432345. Interface 19a at 432361 and 432364 provide interfaces that display all analytes associated with a given assay method.

[00580] In embodiments, a reader module for running a designed experiment may be provided. The reader module may be adapted to allow a user to perform necessary functions, steps, and/or commands as they relate to the loading, reading, and unloading of plates, such as those used for ECL assays, although other experiments and/or assays are contemplated as well. In other embodiments, the Reader module relates to other equipment and/or instruments, such as medical equipment. By way of example, for medical equipment, the Reader module could be used for a Magnetic Resonance Imaging (MRI) device to assist doctors, other medical professionals, and/or technicians while using the machine. Other applications are contemplated as well.

[00581] Referring specifically to FIG. 43H, in certain embodiments, first portion 381821 can include a first menu of user-selectable choices including a Read choice and Review Recent Results choice (although other choices may also be included). The latter is explained in greater detail above with regard to the Experiment Module. In response to a selection of the Read command, a first portion or a second portion of the MUI display 206 is adapted to output a Play Button 432370 as shown, for example in FIG. 43C. The Play Button 432370 can be embodied as a graphical-based selectable input as shown in this figure, or it take other forms as well, including a non-graphical and/or text-based selection. When embodiment in a graphical selection, other geometric shapes may be employed in addition to the ones shown in this figure.

[00582] In response to a selection of the Play Button 432370, a plate reader is adapted to begin reading and/or analyzing one or more plates. The read process is described in greater detail herein in conjunction with one or more of the other modules described herein. As the one or more plates are read, the MUI display 206 is adapted to display a timer 432371 as shown in FIG. 43D. The timer 432371 is adapted to indicate, for example, in a visual representation one or more of: (a) the total amount of time to load the one or more plates; (b) the total amount of time to read the one or

more plates; (c) the total amount of time to unload the one or more plates; (d) the time remaining to complete the loading of the one or more plates; (e) the time remaining to complete the reading of the one or more plates; and (f) the time remaining to complete the unloading of the one or more plates. In the embodiment shown in this figure, the timer includes three circles, each of which can provide a separate timer for the load, read, and unload processes, e.g., first, second, and third circles, respectively. In certain embodiments, the load process includes the time it takes a plate reader or other instrument to automatically load the plate to be read. Similarly, the unload process can include the time to automatically unload the plate after it has been read. Timers for these processes are not necessarily limited to automated plate-reading instruments but apply to manually fed instruments as well.

[00583] In some embodiments, the timer 432371 can toggle between a logo, e.g., a logo containing three circles, and a countdown timer wherein the perimeter of each circle be modified as time elapses to signify a countdown. For example, a completed circle can represent the beginning time and the perimeter forming the circle can be deleted in a clockwise or counter-clockwise fashion to represent that time has elapsed. This can continue until the entire perimeter of the circle vanishes, representing that the entire timer has elapsed. In other examples, the perimeter lines forming the circle can fade vis-à-vis the unexpired portions of the timer as time elapses so as to illustrate that time has elapsed, while still maintaining the perimeter line of each circle. In other embodiments, rather than fading, the lines can be highlighted, and/or colored to signify how much time has elapsed, and how much time still remains for each of the load, read, and unload processes until they are complete. In other embodiments, other geometric shapes can be used for these times, either all the same, or one or more being of a different shape from the others. In some embodiments, fewer or greater than three of these geometric shapes can be utilized for the timer function.

[00584] In one embodiment, as shown in FIG. 43E, the additional aspects and/or features of the Reader module can be accessed the advanced context selector 381822 as part of the advanced context menu 381832. In this example, the advanced context menu 381832 is adapted to be displayed in response to a selection of an advanced context selector 381822 (FIG. 39B) when outputted to the MUI display. When displayed, advanced context menu 381832 can include a plurality of commands and/or user-selectable choices arranged in a menu that may take the form

of various configurations, as described in greater detail above in conjunction with the Audit Trail module.

[00585] The advanced context menu 381832 can include one or more commands and/or user-selectable choices. For example, for the embodiment depicted in FIG. 43E, the one or more command and/or user selectable choices can include eject plate 432372, partial plate 432373, set plate run 432374, stop instrument 432375, lock UI 432376, and view plate information 432377, although additional commands and/or user-selectable choices are contemplated as well.

[00586] In response to the eject plate choice 432372, the plate currently loaded into a plate-reading instrument is ejected. In one example, the plate is ejected automatically and fully from the plate-reading instrument. In the alternative, this eject choice can release the plate from the instrument, so that a user, such as a technical, lab manager, etc., can manually remove the plate from the plate reading instrument. In response to the partial plate choice 432373, the first portion (FIG. 43H, 381821) is adapted to receive bar code information as it relates a plate selected among one or more plates. For example, if the current plate does not contain a barcode, if the barcode itself is unreadable, or only a portion of it can be read, a user can manually input the barcode information to designate the plate that the reader module is currently working in conjunction with. This information can be inputted via a touchscreen, keyboard, or any other input manner as described herein. In other examples, the barcode could be inputted automatically with the aid of a barcode reader or the like. The first portion (FIG. 43H, 381821) is further adapted to display a user-selectable option for verifying the authenticity of the bar code information after it is received. When selected, the reader module can verify the inputted barcode against one or more of the databases, e.g., one or more of the databases described herein, of barcode information to determine if there is a match. If a match occurs, the plate can be verified. If no match occurs, the user can either try to input the barcode information again, e.g., in case of transcription error, or can elect to proceed with the unverified plate. Additionally, in response to the partial plate choice 432373, a graphical representation of the current plate can be displayed on the MUI display 206, either without regard to particular sectors, e.g., groups of wells, or on a sector basis by overlaying an outline defining one or more sectors of the plate. In further response to the partial plate choice 432373, the advanced context menu 381832 can include one or more additional commands and/or choices. For example, in the embodiment depicted in FIG. 43F, the menu can include a save partial

plate choice 432378 and a cancel partial plate 432379, which can allow users to save the partial plate information or cancel the plate, e.g., terminate the current use of the plate, respectively.

[00587] In response to the set plate run choice 432374, the first portion (FIG. 43H, 381821) is adapted to receive a name for a plate run associated with a plate. For example, a user can enter, e.g., through an input device, e.g., touchscreen, keyboard etc., the name for the run associated with one or more plates that are to be read by the plate-reading instrument. In some embodiments, this information can already be encoded in the barcode, and thus, the run name will automatically populate. The run can be used for various reasons, for example to allow users to associate several plates together from a single experiment, to allow teams to more easily collaborate on experiments, assays, or analyses that involve one or more plates common to the team, etc.

[00588] In response to the stop instrument choice 432375, the first portion (FIG. 43H, 381821) is adapted to display a confirmation choice before issuing a stop instrument command. For the example shown in FIG. 43G, the first portion 381821 can include a confirmation choice 381827. This choice can be adapted to be displayed to provide one or more users with the ability to confirm whether they want to abort the current run of the plate. When presented with this confirmation choice 381827, the users can be presented with a choice as to whether they wish to abort the current run of a plate by issuing the stop instrument command, e.g., selecting “Yes” from this menu, or continuing the run by disregarding the stop instrument command, e.g., selecting “No” from the menu. These options are merely exemplary as other choices and/or command prompts are contemplated as well. If the stop instrument command is issued, the users can be automatically prompted on MUI display 206 with a menu of choice that are available in response to the Review Recent Results choices as described above, thus allowing the user to review the results of previously completed plates. In other words, in this example, by issuing the stop instrument command, the user will be directed automatically to Review Recent Results menu as described above. If the stop instrument command is disregarded, the timer 432371 (FIG. 43D) as described above can be re-displayed on the MUI display 206 throughout the remaining duration of the run in accordance with that feature as described above.

[00589] In response to the lock UI choice 432376, the MUI display 206 is adapted to be locked from user selections until receiving the current user’s password. In this manner, input will be received from a user, whether it is through command and/or choice selections or other inputs, e.g., mouse clicks or scrolling, keyboard strokes, touchscreen inputs, etc., but those selects will not

cause any modification to what is outputted to MUI display 206, nor will commands be received based on this user input, other than the password to unlock the MUI display 206. After this choice is selected, the MUI display 206 will remain locked throughout the duration of the plate run and will automatically unlock once the run is complete. In other embodiments, the MUI display 206 will remain locked until the current user's password is received. In response to the view plate information choice 432377, information that relates to one or more plates can be displayed. The information includes one or more of the plate run name, as described in greater detail above, plate barcode, e.g., the barcode provided by the plate manufacturer, long side customer barcode, e.g., a customer-specific barcode affixed to the long side of the plate, short side customer barcode, e.g., a customer-specific barcode affixed to the short side of the plate, plate type, e.g., single well, multi-well, assay time, coating type, etc., operator, e.g., user, team, account, etc., and read time, e.g., read time of one or more individual plates and/or total read time of the plates for a given plate run.

[00590] In FIG. 44 is an embodiment of a user experience flow through an audit trail module beginning with analytical user app at 442400 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in analytical user app at 442400 being labelled "1." as the first step. The user experience flow of FIG. 44 may be facilitated by a MUI as described herein. At 442401 a user may select a user interface mechanism presenting one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option. At 442402, a work flow starts and the MUI auto-transitions to all audit events at 442403 to present to a user a view of all events captured for a user's current team with each event including, but not limited to, username and/or email address of originator, date and timestamp, the source, and information pertaining the event as returned from a service request made via the cloud platform. This view at 442403 enables a user to sort the view in forward or reverse ordering by username, date and timestamp, source, or information about the event. At 442403 a user may use the function selection mechanism at 442401 or an export command in the menu provided at 442403 to export the entire collection of events at 442404 to a file format easily importable to other computer applications such as, without limitation, Excel, Word, and/or any other computer application, such as, CSV, tab-delimited text,

JSON, XML, and/or any other format. At 442403 a user may use the function selection mechanism at 442401 to export the entire collection of events at 442404 to a computer operating system mechanism used for copying and pasting content from one computer application to another computer application often referred to as a clipboard.

[00591] In FIG. 45 is an embodiment of software modules in a coordinated-operation instrument app 452500 forming the user interface experience for the use of a coordinated-operation instrument with each module using services provided by cloud platform 452504 to create, read, update, and/or delete any and all data relevant to each module's processing and commanding and controlling physical hardware integrated with, or separate from, the coordinated-operation instrument, as well as, any other services needed for each module's processing. Use of the coordinated-operation instrument app 452500 may be facilitated by a MUI as discussed herein. Accordingly, the coordinated-operation instrument app 452500 may include a methodical user interface control system 1102 or may operate in conjunction with a methodical user interface control system 1102. Operation module 452501 may be the active module by default when the coordinated-operation instrument app 452500 starts. Operation module providing the interface for executing experiments on an instrument to collect data for samples using assay methods defined in an experiment. Maintenance module 452502 provides the interface for executing maintenance functions on the instrument to ensure optimal operation of the instrument. A collection of system functions 452503 provides typical utilities in support of use of the coordinated-operation instrument such as, but not limited to, logging off, viewing help information, viewing user guide, viewing legal notices and/or documents, changing software configuration, changing user password, and/or other utilities. The collection of system function 452503 may be provided as a separate MUI module and/or a series of software protocols that operate alongside the other discussed MUI modules. A user can log into a coordinated-operation instrument app 452500 through system functions 452503 using services provided by cloud platform 452504. If authentication of a user by a login service on cloud platform 452504 returns that a user has more than one account and/or team, a user will be required to select the default account and/or team, but if a user does not belong to more than one account and/or team, the service on the cloud platform 452504 would auto-assign a user to the sole account and team for that user. On completing login, the user lands at start of the operation module and begins using the coordinated-operation instrument app as they need. In an alternative, the coordinated-operation instrument app 452500

can assist in performing other experiments in addition to or in place of the assay experiments described herein.

[00592] In FIG. 46 is an embodiment of a user experience flow through an operation module in the coordinated-operation instrument app at 462600 running on a instrument's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in coordinated-operation instrument app at 462600 being labelled "1." The user experience flow of FIG. 46 may be facilitated via a MUI as discussed herein. At 462601 a user is logging into the coordinated-operation instrument app. After the login process the user interface transitions to start at 462602 and on login the MUI presents a menu of items including 1) selecting an experiment to run at 462604, 2) reviewing recent results of previous runs at 462611, 3) selecting a user interface mechanism at 462603, 4) processing a run at 462613, and 5) reviewing runs at 462620.

[00593] The user interface mechanism at 462603 presents one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option.

[00594] In choosing to select an experiment to run at 462604 the MUI presents a next menu of options to the user to select from recent experiments at 462605 or available experiments at 462606 with the default being recent at 462607. The MUI may auto-transition to all experiments at 462608 if recent at 462607 is empty as returned from a service request made via the cloud platform. At 462605 on selection of recent experiments a user is presented a configurable amount, for example twenty five, of the most recently designed experiments to run at 462607 as returned from a service request made via the cloud platform, although any other number of recently designed experiments is contemplated as well. Alternatively, selection of available at 462606 presents to a user all designed experiments ready to be run at 462608 as returned from a service request made via the cloud platform with the experiments organized by username, date and time of creation, and experiment name, enabling a user to browse the various experiments and to select the experiment to run.

[00595] On selecting an experiment to run either at 462607 or at 462608, the MUI transitions to process the experiment run that has just been selected at 462613 through the user interface

leading a user through loading consumables and samples onto the appropriate locations on the instrument for the experiment's run at 462614 and on completing the load automatically transition to selecting to run the experiment at 462615. On selecting to run the experiment at 462615 the software initiates an automated inventory check of what was loaded by the user at 462614 through scanning of barcodes as appropriate presenting errors to the user to correct any issues that arise and on confirmation of 100% correctness of what was loaded, initiating the run and the automated execution of the experiment's assigned assay methods against the samples under test with one or more types of timers presenting the time remaining in the run while also enabling a user to see live video of the instrument running. On completion of the run the MUI presents instructions at 462616 for the user to unload the instrument leading the user through the process of removing consumables and samples from the instrument, as well as, emptying bulk containers used in the processing. On completion of the unload the MUI transitions to present to the user plate results at 462622 viewing the entire set of plates processed in the run at 462622 then choosing a plate to review in greater detail either at 462629, at 462630, and/or at 462631; and finally enabling a user to return to start at 462602 to perform another experiment run.

[00596] In an alternative to selecting an experiment to run at 462604, the user may choose to review recently ran experiments at 462611, cause the MUI to present a next menu of items to the user to select from runs at 462621 or plates at 462622. Upon selecting runs at 462621, a next menu provided by the MUI permits the user to select from recent ran experiments at 462623 or available ran experiments at 462624 with the default being recent at 462623. The MUI may auto-transition to available experiments at 462624 if recent at 462623 is empty as returned from a service request made via the cloud platform. At 462623 on selection of recent a user is presented a configurable amount, for example twenty five, of the most recently ran experiments to review at 462625 as returned from a service request made via the cloud platform. Alternatively, selection of available experiments at 462624 presents to a user all ran experiments ready to be reviewed at 462626 as returned from a service request made via the cloud platform with the experiments organized by username, date and time of creation, and experiment name, enabling a user to browse the various experiments and to select the experiment to review. On selecting an experiment to review either at 462625 or at 462626 the user interface transitions to present to the user plate results at 462622 viewing the entire set of plates processed in the run at 462622 then choosing a plate to review in greater detail either at 462629, at 462630, and/or at 462631. Although this embodiment describes

methods for performing assays and/or plate-based tests, other experiments and tests are contemplated as well.

[00597] In FIG. 47 is an embodiment of a user experience flow through an maintenance module focused on maintaining an instrument beginning with coordinate-operation instrument app at 472700 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in coordinated-operation instrument app at 472700 being labelled "1." as the first step. The experience flow of FIG. 47 may be implemented via MUI as described herein. At 472701 a user may select a user interface mechanism presenting one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option, choosing maintenance module. On selection of maintenance module at 472701 the application transitions at 472702 to the start of the maintenance module and presents at 472703 an option to run a maintenance method or at 472704 an option review results of a previously ran maintenance method.

[00598] On selecting at 472703 a user is presented on the user interface the set of maintenance methods to run organized in a left set of top-level maintenance categories including but not limited to initializing the instrument, issuing a component command, and running a component test and associated with each item in the left set would be a right set of one or more maintenance methods pertinent to the instrument being maintained associated with the left maintenance category from which a user would select the maintenance method to perform. Once a maintenance method is selected at 472703 the software transitions to process the maintenance method at 472705 presenting the user a run button to initiate the processing and on tapping the run button the software initiates the robotic processing associated with the maintenance method presenting a user an hours:minutes:seconds countdown timer in various animations that a user could toggle through based on their preferences, as well as, an option to a live video to watch the robotic processing associated with the maintenance method. The maintenance method process menu at 472705 may be accessed via the start menu or may be auto-transitioned to after completion of the menu at 472703.

[00599] Once the maintenance method's robotic processing completes at 472706, the user interface transitions to 472707 for a user to review (also reachable via the start menu 472702) any results reported by the maintenance method presented in a table sorted by most recently run maintenance method showing the username of the person who ran the maintenance method, the name of the maintenance method, the date and time of completion of the maintenance method, and an optional result of the maintenance method if it reports a result. A user may select start at 472702 to return to the option of running another maintenance method at 472703 or reviewing maintenance results at 472704 or selecting a different module to switch to at 472701. On selecting reviewing maintenance results at 472704 the user interface is transitioned to 472707 to present to a user the previously disclosed maintenance method results table for FIG. 47.

[00600] In FIG. 48 is an embodiment of software modules in an individual-operation instrument app 483000 forming the user interface experience for the use of an individual-operation instrument with each module using services provided by cloud platform 483003 to create, read, update, and/or delete any and all data relevant to each module's processing and commanding and controlling physical hardware integrated with, or separate from, the individual-operation instrument, as well as any other services needed for each module's processing. Operation module 483001 may be the active module by default when an individual-operation instrument app 483000 starts. Operation module 483001 provides the interface for executing an operation provided by the instrument in support of processing a defined assay method on samples for ultimate collection of data from the samples under test. 483002 Collection of system functions 483002 provides typical utilities in support of use of the individual-operation instrument such as, but not limited to, logging off, viewing help information, viewing user guide, viewing legal notices and/or documents, changing software configuration, changing user password, and/or other utilities. The collection of system function 483002 may be provided as a separate MUI module and/or a series of software protocols that operate alongside the other discussed MUI modules. As discussed above, the individual-operation instrument app 483000 may employ a MUI supplied by a methodical user interface control system 1102 for interface purposes. The operation module 483001 and the system functions 483002 may all employ a MUI for user interface purposes. A user will log into an individual-operation instrument app 483000 through system functions 483002 using services provided by cloud platform 483003. If authentication of a user by a login service on cloud platform 483003 returns that a user has more than one account and/or team, a user will be required to select

the default account and/or team, but if a user does not belong to more than one account and/or team, the service on the cloud platform 483003 would auto-assign a user to the sole account and team for that user. On completing login, the user lands at start of the operation module 483001 and begins using the individual-operation instrument app 483000 as needed. In the alternative, the of software modules in an individual-operation instrument app 483000 can support other experiments in addition to or in place of the assay experiments described herein.

[00601] In FIG. 49A is an embodiment of a user experience flow through an operation module in the individual-operation instrument app at 493100 running on a instrument's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in individual-operation instrument app at 493100 being labelled "1." The experience flow depicted in FIG. 49A may be implemented or facilitated by a MUI as discussed herein. At 493101 a user logs into the individual-operation instrument app 483000. After the login process the user interface transitions to start at 493102 and the user is presented with a first menu of items, including 1) perform the operation at 493104, 2) review recent results of previous performances of the operation at 493105, or 3) select a user interface mechanism at 493103. The user interface mechanism 493103 presents one or more options including, but not limited to, module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a scroll-wheel menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option.

[00602] On selection by a user to run a process at 493104 the MUI transitions to 493106 to prepare the instrument to execute the process. The MUI presents a progress indicator to keep the user apprised of progress and ultimate completion. The software may further provide a mechanism to perform the operation in a continuous mode, or repeat the operation on a new plate, if a user chooses to stack or batch plates up for processing. On completion of the operation over one or more plates, the data collected from the operation may be uploaded through services provided on the cloud platform to the user's team for review via the cloud as well as storing performance data gathered from the operation of the instrument for monitoring and support by the provider of the instrument, then the user interface would automatically transition to review at 493105 presenting instrument-specific results at 493107 of the one or more operations that just completed. Alternatively to performing the operation at 493104, the user could choose review at 493105 to

cause the MUI to transit to present instrument-specific results at 493108 where the user is presented a maximum set of recent results that could be the last 'n' plates (e.g., 25) processed, the last 'n' days (e.g., 30), or any other desired configuration for presenting chronologically recent set of results provided by the instrument. In an alternative to performing the operation at 493104 or reviewing recent results at 493105, the user could choose one or more functions at 493103, including configuring the operation of the instrument for ultimate use. A user may perform the operation at 493104 time and time again, then review the results at 493105 to determine if the instrument performed as expected.

[00603] In FIG. 49AA another embodiment of a user experience flow through an operation module in the individual-operation instrument app at 493100 running on a instrument's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in individual-operation instrument app at 493100 being labelled "1." as the first step, also as a user works through the flow of a user interface they could easily backtrack to a previous step. The experience flow depicted in FIG. 49AA may be implemented or facilitated by a MUI as discussed herein. At 493101 a user is logging into the individual-operation instrument app 483000. After the login process the MUI transitions to start at 493102, since the operation module is envisioned in this embodiment to be the default first module after a user logs in, where on login the user has two options either Option 1) to perform the operation at 493104, or review recent results of previous performances of the operation at 493105, or Option 2) select a user interface mechanism at 493103 presenting one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option.

[00604] On selection by a user to perform the operation at 493104 the MUI transitions to 493106 to prepare the instrument then execute the operation presenting to the user a progress indicator to keep the user apprised of progress and ultimate completion. The software may further provide a mechanism to perform the operation in a continuous mode, or repeat the operation on a new plate, if a user chooses to stack or batch plates up for processing. On completion of the operation over one or more plates, the data collected from the operation may be uploaded through services provided on a cloud platform to the user's team for review via the cloud as well as storing

performance data gathered from the operation of the instrument for monitoring and support by the provider of the instrument, then the MUI may automatically transition to review at 493105 presenting instrument-specific results of the one or more operations that just completed at 493108. Alternatively to performing the operation at 493104, the user could choose review at 493105 with the MUI transitioning to present instrument-specific results at 493108 where the user is presented a maximum set of recent results that could be the last 'n' plates (e.g., 25) processed, the last 'n' days (e.g., 30), or any other desired configuration for presenting chronologically recent set of results provided by the instrument. Alternatively, to performing the operation at 493104 or reviewing recent results at 493105, the user could choose one or more functions at 493103, including configuring the operation of the instrument for ultimate use. Typically, but not limited to, a user would perform the operation at 493104 time and time again, then reviewing the results at 493105 to see if the instrument performed as expected.

[00605] FIG. 49B illustrates an embodiment of the flow of results review in an operation module 403120 specifically for a plate reader as an individual-operation instrument. The plates menu at 493121 is a collection of one or more plates in the order of operation execution and on selection of a plate at 493121 the MUI transitions to present options at 493122, at 493123, and at 493124. At 493122 a user is presented a specific plate in the experiment with a heat map representation of signal for all data locations in each well of the plate. A user may choose a particular data location to view across all wells of the plate narrowing down the data to just that one data location plus a user may select a particular well to see the specific signal value for a sample in the selected well while being able to change the high and/or low signal range for the plate to alter the intensity of the heat map across all samples visible on the plate. At 493123 a user is presented a well-by-well table view of the data presenting but not limited to sample identifier, data location, and signal. At 493124 a user is optionally presented a table view of flags denoting abnormal events that may have occurred during processing of a plate potentially bringing the data's quality into question for a user only available to a user if there was at least one flag generated for a plate. Although this embodiment describes plate-reader operations and/or applications, the methods described herein can be applied in the alternative to the review of other experiments and tests in the alternative.

[00606] In FIG. 50 is an embodiment of software modules in an workflow-aid instrument app at 503200 forming the user interface experience for the use of a workflow-aid instrument with

each module using services provided by cloud platform at 503203 to create, read, update, and/or delete any and all data relevant to each module's processing and potentially commanding and controlling physical hardware integrated with the workflow-aid instrument, as well as, any other services needed for each module's processing, wherein, collect and prepare module at 503201 would be the active module by default when the workflow-aid instrument app at 503200 starts. The workflow-aid instrument app 502300 may employ or be implemented along with a MUI to provide user interfaces for the collect and prepare module 503201 and the system functions 503202. At 503201 is a collect and prepare module providing the interface for gathering constituent components stored in potentially different climate-controlled or room temperature environments to be used in processing one or more assays in a chosen experiment, for example but not limited to, kits, antibody sets, bulk solutions, plastic-ware such as tips and microtiter plates, and/or any other component required to be used in processing one or more assays in a chosen experiment; and preparing constituents components requiring pre-processing prior to being used in the processing of one or more assays defined for an experiment, for example, rehydrating lyophilized reagents, thawing frozen reagents, pretreating samples, and/or any other step required to prepare constituent components to be used in processing one or more assays in a chosen experiment. At 503202 is a collection of system functions providing typical utilities in support of use of the workflow-aid instrument such as but not limited to logging off, viewing help information, viewing user guide, viewing legal notices and/or documents, changing software configuration, changing user password, and/or other utilities. A user will log into a workflow-aid instrument app at 503200 through system functions at 503202 using services provided by cloud platform at 503203. If authentication of a user by a login service on cloud platform at 503203 returns that a user has more than one account and/or team, a user will be required to select the default account and/or team, but if a user does not belong to more than one account and/or team, the service on the cloud platform at 503203 would auto-assign a user to the sole account and team for that user. On completing login, the user lands at start of the collect and prepare module and begins using the workflow-aid instrument app as they require.

[00607] In FIG. 51 is an embodiment of a user experience flow through a collect and prepare module in the workflow-aid instrument app at 513300 running on a instrument's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in workflow-aid instrument app at 513300

being labelled “1.” as the first step. The experience flow of FIG. 51 may be implemented via a MUI as discussed herein. At 513301 a user is logging into the workflow-aid instrument app. After the login process the user interface transitions to start at 513302 since the collect and prepare module is envisioned in this embodiment to be the default first module after a user logs in, where on login the user has four options either 1) select an experiment ready to begin collect and prepare at 513304, 2) select an in-progress experiment to continue collect and prepare at 513305, 3) select an experiment that was previously collected and prepared at 513306, or 4) select a user interface mechanism at 513303 presenting one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a dropdown menu and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option. On selection by a user to begin an experiment ready to be collected and prepared at 513304 the user interface presents the set of experiments ready to be processed by calling a cloud service returning the available experiments and presenting the set of returned experiments, on user selection of a particular experiment transitioning to collect at 513307.

[00608] On transition by the MUI to 513307 the user is presented options to collect under various temperature storage modalities as required by the assay methods chosen for the experiment, in this embodiment but not limited to, -20C at 513308, -80C at 513309, 4C at 513310, and at room temperature at 513311. The collect menu at 513307 is an example of a walk-through type execution menu, as described herein. Under each temperature zone the user will be presented a collection of assay methods each with one or more assay components to be collected from that temperature zone as returned by a call to a cloud service for the experiment being collected. The collection could be presented as a linear list to lead the user through the collection one item at a time requiring the user to check off each item as items are collected or a user could jump to the end of collection in a temperature by choosing to select a check-all control because they do not need to be led through collect. As a user works through the list of items to collect, they could be presented to the right of the list a photo or graphic representation of the item to be collected with a breakdown of its one or more constituent components if an item has one or more constituent components. To aid quick selection of an item the user could scan a barcode on the item that will automatically detect the item being collected and check it off in the list of items to be collected regardless of the item's position in the list. On checking off an item in the list a cloud service is

called to store this information and the list automatically transitions to the next item to collect. Important to note a user could choose to jump around from one temperature zone to another as they wish, as well as, a function could be provided under function selection at 513303 to re-arrange the order of the temperature zones if a user wants a different order. A user may also be provided a function under function selection at 513303 (e.g., an advanced context menu) to print out the steps of collect if they prefer to have a paper copy, as well as, a function under function selection at 513303 to export the steps of collect to some 3rd party software application. Once all items have been collected in a particular temperature zone a cloud service is called to update the experiment with its collection being completed and the user interface transitions to the next temperature zone continuing the process of collection until such time as the last item in the last temperature zone has been collected transitioning the user interface to prepare at 513312. The prepare menu at 513312 is an example of a walkthrough type execution menu.

[00609] On transition to prepare at 513312 the user is presented in this embodiment an aggregate list of the steps to be performed across all assay methods chosen for the experiment as returned by a call to a cloud service to retrieve the chosen assay methods for the experiment with the list ordered by the first step to last step defined for an assay method where assay methods sharing a common type of step in this embodiment would provide a sub-step selection for each common step type such that a user could perform the step for each assay method checking it off for each assay method or the user could check it off once for the step covering all associated assay methods. An alternative to the sub-step approach, but not intended to be limited to, would be a one-level list with one step for each step and assay method pairing. Regardless of how the steps are presented to a user, the one or more actions to be taken for the one active step to be performed by a user in this embodiment, but not intended to be limited to, would be presented to the right of the list of steps where the actions would be presented to a user as a video, one or more graphical representations, and/or text description with the intention this information helps a user properly perform the one or more actions of the step. As a user completes the actions of a step, whether for one assay method or many assay methods, they would check off the step causing a call to a cloud service to store the completed state for the step for all assay methods associated with that step.

[00610] Once all steps for all assay methods have been completed, denoted by checking off the step, prepare will be complete with the user asked via a modal dialog to confirm completion, where, positive confirmation of completion causes a call to a cloud service to update the state of

the experiment to indicate it has been prepared and returning the user interface to start at 513302 with the experiment now ready to be processed; and negative confirmation of completion returns the user to the last performed step in prepare at 513312. A supplemental function available in any stage of collect and prepare under function selection at 513303 is the ability to display, export to 3rd party software, and/or print the one or more sample input plates associated with an experiment.

[00611] In FIG. 52 is an embodiment of the computing flow of software automatic update for bioanalytical user computers at 513408 in the analytical computing system at 513402. The flow is represented in a “swim lane” diagram depicting independent computing systems operating concurrent to each other being computing system provider business system at 513401, cloud platform at 513403 with its software release services at 513406, and bioanalytical user computers at 513408 with its bioanalytical user update service at 513423 with processing swim lane for computing system provider business system at 513401 depicted above dotted line at 513412, processing swim lane for software release services depicted between dotted lines at 513412 and 513419, and processing swim lane for bioanalytical user update service at 513423 depicted below dotted line at 513419. The processing of computing system provider business system at 513400 is depicted as out of scope for the analytical computing system at 513402 with the dotted-line outline of analytical computing system provider environment at 513400 but in this embodiment software updates originate there at 513409 when a new release of software is produced for deployment with one or more files associated with the new release bundled at 513410 and pushed to cloud platform through file upload services inherent to the cloud platform then transitioning at 513411 to call a web service on the cloud platform at 513403 to request an auto-update of the software on various bioanalytical user computers at 513408. The processing of software release services at 513406 has two concurrent services, one service to create a software update record at 513413 provided for an outside agent to notify the analytical computing system at 513401 that an auto-software update is requested that in this embodiment occurs at 513411 and a second service for bioanalytical user computers to check for availability of an auto-software update at 513416. The service at 513413 receives a requesting to create the software update record, confirms at 513414 the request is a valid service request from an appropriately credentialed requester and if not valid the request is rejected and not processed, but if proper a new auto-software update is created for the version of software at 513415. The service at 513416 receives a request to check if there is an active auto-software update, confirms at 513417 the request is a valid service request

from an appropriately credentialed requester and if not valid the request is rejected and not processed, but if valid the download link to the software update is returned to the requester. The processing of bioanalytical user update service at 513423 is a periodically executed service requesting availability of updates at 513420 via a web service call at 513416 and on receipt of a response checking the response at 513424 to either repeat the service request if not available or processing the software update if available at 513421 by downloading the software update via the download link provided by web service call at 513416 and on completion of the download executing the software install at 513422 and after completion of the install the bioanalytical user computer software is updated. Although this figure uses the term “bioanalytical,” it applies to any analytical computing system, system provider, user, user computer, etc.

[00612] In FIG. 53 is an embodiment of the computing flow of software automatic update for bioanalytical instrument computers in the analytical computing system at 513502. The term “bioanalytical instrument” is used in this context to represent any and all of the before-mentioned coordinated-operation instrument, individual-operation instrument, and/or workflow-aid instrument, generalized in FIG. 53 for simplicity of description since they operate the same in this regard. The flow is represented in a “swim lane” diagram depicting independent computing systems operating concurrent to each other being computing system provider business system at 513501, cloud platform at 513503 with its software release services at 513506, and bioanalytical instrument computers at 513508 with its instrument update service at 513523 with processing swim lane for computing system provider business system at 513501 depicted above dotted line at 513512, processing swim lane for software release services depicted between dotted lines at 513512 and 513519, and processing swim lane for instrument update service at 513523 depicted below dotted line at 513519. The processing of computing system provider business system at 513500 is depicted as out of scope for the analytical computing system at 513502 with the dotted-line outline of analytical computing system provider environment at 513500 but in this embodiment software updates originate there at 513509 when a new release of software is produced for deployment with one or more files associated with the new release bundled at 513510 and pushed to cloud platform through file upload services inherent to the cloud platform then transitioning at 513511 to call a web service on the cloud platform at 513503 to request an auto-update of the software on various bioanalytical instrument computers at 513508. The processing of software release services at 513506 has two concurrent services, one service to create a software

update record at 513513 provided for an outside agent to notify the analytical computing system at 513501 that an auto-software update is requested that in this embodiment occurs at 513511 and a second service for bioanalytical instrument computers to check for availability of an auto-software update at 513516. The service at 513513 receives a requesting to create the software update record, confirms at 513514 the request is a valid service request from an appropriately credentialed requester and if not valid the request is rejected and not processed, but if proper a new auto-software update is created for the version of software at 513515. The service at 513516 receives a request to check if there is an active auto-software update, confirms at 513517 the request is a valid service request from an appropriately credentialed requester and if not valid the request is rejected and not processed, but if valid the download link to the software update is returned to the requester. The processing of instrument update service at 513523 is a periodically executed service requesting availability of updates at 513520 via a web service call at 513516 and on receipt of a response checking the response at 513524 to either repeat the service request if not available or processing the software update if available at 513521 by downloading the software update via the download link provided by web service call at 513516 and on completion of the download executing the software install at 513522 and after completion of the install the bioanalytical instrument computer software is updated. Although this figure uses the term “bioanalytical,” it applies to any analytical computing system, system provider, user, user computer, instrument, etc.

[00613] The methods, techniques, and systems are described herein particularly with respect to instrumentation and bioinstrumentation. The methods, techniques, and systems, however, are not limited to such applications. MUIs as provided herein may be applied to any activity or process that may be structured according to a hierarchical process flow. MUIs as provided herein may be applied to processes in a variety of additional fields, including, for example, home and interior design, furniture assembly, cooking and meal design, travel planning, business planning, graphic design (e.g., business cards, invitations, crafts such as quilting, knitting, and sewing, web pages, etc.), financial planning, bank account management, taxes, wills, video game design, video editing, media navigation (e.g., Netflix®, tv channel navigation), car purchase, home purchase, beer brewing, manufacturing, project management in any field, etc.

[00614] In FIG. 54 is an embodiment of an example of a non-bioanalytical use of the disclosed architecture for software modules in an chef app at 513600 forming the primary user interface

experience for creating a meal for one or more people with each module using services provided by cloud platform at 513606, assuming relevant chef-related services are available on cloud platform at 513606, to create, read, update, and/or delete any and all data relevant to each module's processing, as well as, any other services needed for each module's processing, wherein, meal planner module at 513601 would be the active module by default when the chef user app at 513600 starts, guiding a chef through the planning of the meal they wish to create. The chef app 513600 may be implemented in conjunction with a MUI to provide a user interface. At 513602 is an ingredient collection module providing the interface for guiding a chef and/or their designee through the purchasing and/or retrieval of all ingredients and/or anything required for the execution of the meal either used in meal preparation and/or used during eating the meal. At 513603 is a meal preparation module used to guide a chef and/or their designee through the steps of cooking the meal. At 513604 is a meal execution module used to guide a chef and/or their designee in setting the stage and mood for the meal as well as the timing of various courses of the meal. At 513605 is a collection of system functions providing typical utilities in support of use of the system such as but not limited to logging off, viewing help information, viewing user guide, viewing legal notices and/or documents, changing software configuration, changing user password, and/or other utilities. A user will log into the chef user app at 513600 through system functions at 513605 using services provided by cloud platform at 513606. On completing login, the user lands at start of the meal planner module at 513601 and begins using the chef user app at 513600 as they need. Only the meal planner module at 513601 will be further disclosed for the purpose of illustration of an example of a non-bioanalytical use.

[00615] In FIG. 55 is an embodiment of a user experience flow through an meal planner module beginning with chef app at 513700 running on a user's computer with each step through a user interface numbered sequentially 1 through 'n' to represent the stepwise flow from begin (1) to end ('n') for a user as depicted in chef app at 513700 being labelled "1." as the first step. The user experience flow of FIG. 55 may be implemented via a MUI as described herein. After the login process the user interface transitions to start at 513701 since the meal planner module is envisioned in this embodiment to be the default first module after a user logs in with to options to design a meal at 513703 or at 513704 select a user interface mechanism presenting one or more options including but not limited to module-specific functions, modules to select, and/or system functions being either a horizontal menu and/or toolbar, a vertical menu and/or toolbar, a dropdown menu

and/or toolbar, a keyboard function, a voice-activated command, and/or any other like user interface mechanism to choose an option. In this embodiment at 513703 a user is presented one option to design a meal plan with a user choosing to do so transitioning the user interface to a choice of creating a new meal plan from scratch at 513705 or creating a meal plan from a pre-existing meal plan at 513706, where choosing new at 513705 transitions the user interface directly to meal plan design setup at 513712 and choosing to base the new meal on a pre-existing meal plan at 513706 transitions the user interface to a choice of recent meal plans at 513707 or available meal plans at 513708 with the default being recent at 513707 but auto-transitioning to available at 513708 if recent at 513707 is empty as returned from a service request made via the cloud platform. At 513707 on selection of recent a user is presented a configurable amount, for example twenty five, of the most recently used meal plans at 513709 as returned from a service request made via the cloud platform. Alternatively, selection of available at 513708 presents to a user all meals at 513710 as returned from a service request made via the cloud platform with the meal plans organized by names of users creating meals plans and the name of the meal plans each user created, enabling a user to browse the various meal plans to select the meal plan of choice. On selection of a meal plan at either 513709 or 513710 the user interface transitions to meal plan design setup at 513712. At 513712 a user is presented a system-provided default name that a user may accept or edit but a plan must have a name; a number of diners for the meal with a default of 2 and a range of 1 to 10000; and an optional monetary budget with a default of no limit and accepting any monetary value; wherein on either accepting the defaults or editing one or more of the options, a user would then select cuisine at 513713 causing a service call on the cloud platform to store the decision made by the user for the options before transitioning the user interface. At 513713 a user is presented a two-part selection user interface mechanism showing on the left a cuisine origin and on the right cuisine options for the chosen origin, for example the left selection would be but not limited to American, European, Mexican, South American, Middle Eastern, Asian or Other, wherein the right selection for American would be but not limited to Southern, New England, Amish, or Southwestern; for European would be but not limited to French, Italian, German, Greek, Spanish, Portuguese, British Isles, or Scandinavian; for Mexican would be but not limited to Traditional or Tex-Mex; for South American would be but not limited to Peruvian or Brazilian; for Middle Eastern would be but not limited to Turkish, Lebanese, or Persian; for Asian would be but not limited to Chinese, Japanese, Thai, Vietnamese, Korean, or Indian; and Other would be

but not limited to Caribbean or Name Your Own for a user provide their own cuisine style; and on user selection of a cuisine option the selection is saved via a service to the cloud platform and the user interface transitions to dietary restrictions at 513714.

[00616] At 513714 a user is presented potential dietary restrictions in a scrollable outline format where at each level of the outline a user is enabled to click something as a restriction that on clicking will check-on the chosen restriction plus everything embedded underneath it in the outline, wherein the outline would be but not limited to:

- Vegetarian;
- Vegan;
- Allergic (Tree nuts, Write in option);
- Health (Lactose, Gluten, Write in option);
- Religious;
- Kosher (pork, shellfish), No dairy, meat okay, No meat, dairy okay, Pareve (no meat or dairy);
- Halal, Write in option; and/or
- Taste, Write in option.

[00617] After a user completes checking all restrictions they know of, they would choose compose meal at 513715 causing their selections to be stored via a web service to the cloud platform and therefore eliminating certain ingredients from meal preparation based on their selections before transitioning the user interface. At 513715 a user is presented three options for planning the meal being defining the courses at 513716, selecting side dishes at 513717, and/or selecting drinks at 513718. On selecting courses at 513716 a user is presented the three system-provided defaults in expected ultimate meal execution order of appetizer course at 513719, main course at 513720, and dessert course at 513721 but the user could alter the course selection and/or order by choosing function selection 513704 to see two functions options to add/remove a course at 513722 to either add one or more courses to the meal and/or remove one or more courses from the meal, as well as, a function to rearrange the courses of the meal for when executing the preparation and/or execution of the meal. At 513719 a user is presented a left-right selection control with the left side being types of dishes to be provided being but not limited to Soup, Salad, Finger Foods, Dips/Sauces, and Other for one or more user-provided choices, where when a preset option is clicked the user interface presents a collection of options set by the cuisine and dietary restrictions defined previously by the user with the options retrieved from web service(s) provided on the cloud platform from which the user may select one or more options. On completion of

option selections and/or definitions at 513719 a user would select main course at 513720 with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning the user interface. At 513720 a user is presented a left-right selection control with the left side being types of dishes to be provided being but not limited to Poultry, Pork, Beef, Fish, Vegetarian, and Other for one or more user-provided choices, where when a preset option is clicked the user interface presents a collection of options set by the cuisine and dietary restrictions defined previously by the user with the options retrieved from web service(s) provided on the cloud platform from which the user may select one or more options. On completion of option selections and/or definitions at 513720 a user would select dessert course at 513721 with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning the user interface. At 513721 a user is presented a left-right selection control with the left side being types of desserts to be provided being but not limited to Cake, Cookies, Pie, Ice Cream, Pastry, and Other for one or more user-provided choices, where when a preset option is clicked the user interface presents a collection of options set by the cuisine and dietary restrictions defined previously by the user with the options retrieved from web service(s) provided on the cloud platform from which the user may select one or more options. On completion of option selections and/or definitions at 513721 a user would select the next course if one is available until the last course is defined then select side dishes at 513717 with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning the user interface. At 513717 a user is presented a left-right selection control with the left side being types of side dishes to be provided being but not limited to Bread, Starch, Vegetable, Dips/Sauces, and Other for one or more user-provided choices, where when a preset option is clicked the user interface presents a collection of options set by the cuisine and dietary restrictions defined previously by the user with the options retrieved from web service(s) provided on the cloud platform from which the user may select one or more options. On completion of option selections and/or definitions at 513717 a user would select drinks at 513718 with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning the user interface. At 513718 a user is presented a left-right selection control with the left side being types of drinks to be provided with sub-options of for alcohol at 513724 and non-alcohol at 513725 with options for alcohol being but not limited to Wine, Beer, Liquor, and Other for one or more user-provided choices and options for non-alcohol being Soda, Juice, Water, and Other for one or more user-

provided choices, where when a preset option is clicked the user interface presents a collection of options set by the cuisine and dietary restrictions defined previously by the user with the options retrieved from web service(s) provided on the cloud platform from which the user may select one or more options, as well as, optionally associate each specific drink to a specific course if the user desires that specificity. On completion of option selections and/or definitions at 513718 a user would select confirm at 513726 because their meal is now defined with the software automatically storing the user's selections via web service(s) on the cloud platform before transitioning the user interface. At 513726 a user is presented a summary view of the meal they have planned to confirm they made all the right choices, enabling a user to navigate to a previous steps to alter any decisions they made in the process of planning the meal and if all their decision are in line with their expectations they would select confirm storing their meal plan via web service(s) to the cloud platform for future use and on completion of the invocation of web service(s) the user interface would transition back to start at 513702. At 513702 a user could choose a function selection user interface mechanism at 513704 seeing they are in a meal planner module and having three other modules available to them namely, an ingredient collection module, a meal preparation module, and a meal execution module helping them follow through on their new meal plan using one or more of these other modules.

[00618] In another example, in a cooking and meal design MUI module, a process flow may be structured as follows. A first menu may permit a user to select a type of meal, dinner, lunch, breakfast, formal, informal, etc., that is being prepared. Selection of a type of meal may lead to a next menu permitting a user to select a number of dishes to be prepared. A next menu may permit a user to select a cuisine style. A next menu may permit a user to select dish options, filtered by the cuisine style, for each dish. After completion of menu design, a recipe module may be selected. The recipe module may use a MUI as discussed herein to permit a user to quickly navigate between recipes of dishes selected for a menu. For example, a first menu may include each dish. A second menu may include options for ingredient lists and recipe steps. In this manner, a user might access the first menu in the historical portion to quickly jump between recipes while viewing navigating ingredients and steps of each individual recipe in the active portion of the MUI.

[00619] In another example, a cooking and meal design MUI module may operate as follows. A first menu may permit a user to select and define a plurality of meal parameters. For example,

in a first menu, a user may select from menu items including cuisine selection, dietary restrictions, number of diners, meal design, wine pairing, and meal preparation.

[00620] Selecting the cuisine selection option permits a user access to a second menu of cuisine options, including, e.g., American, European, Mexican, Caribbean, South American, Middle Eastern, and Asian. Selecting from among the second menu options may lead to a third menu, for example, the American selection may lead to Southern, Southwestern, Texan, New England, Amish, Californian, etc., the European selection may lead to French, Italian, German, Greek, Spanish, Portuguese, British Isles, Scandinavian, etc., the South American selection may lead to Peruvian, Brazilian, etc., the Asian selection may lead to Chinese, Japanese, Vietnamese, Thai, Korean, Indian, etc.. In embodiments, a user may select more than one cuisine option from the second menus that may provide a filter for other menus that a user may interact with.

[00621] Selecting the dietary restrictions option from the first menu permits a user to select from a second menu including options such as vegetarian, vegan, pescatarian, ovo-lacto vegetarian, allergies, health, religious, and taste. The vegetarian, vegan, pescatarian, and ovo-lacto vegetarian menus may be execution menus permitting the user to apply these restrictions as filters to meal choices and/or ingredients. The allergic and health menus lead to execution menus permitting a user to filter ingredients that should be restricted due to health or allergic reasons, such as tree nuts and shellfish (allergic), lactose and gluten (health). Both menus may further permit a user to write in additional options. The religious menu permits a user to access menus that filter based on religious dietary laws, such as Kosher or Halal restrictions. The Kosher menu selection offers a user execution menu including meat (filtering out all dairy options), pareve (filtering out all dairy and meat options), dairy (filtering out all meat options), Passover (filtering out all options including Chametz and/or Kitniyot). Executing any Kosher menu further serves to eliminate all non-Kosher ingredients, such as pork, shellfish, etc. The Halal menu selection offers a user an execution menu permitting the filtering of menu ingredients according to Halal restrictions. The taste menu is an execution menu permitting a user to filter out ingredient selections by diner taste.

[00622] The number of diners menu is an execution menu permitting a user to select a number of diners. Selecting the number of diners allows the module to modify recipe amounts to match the number of people eating. In embodiments, the number of diners menu may also allow a user to select options such as light, medium, and heavy as a further modifier on an amount of food to be prepared.

[00623] The meal design or meal composition selection offers a second menu of appetizer (which in turn offers a third menu of soup, salad, other), main course (which in turn offers a third menu of poultry, pork, beef, fish, vegetarian), side dishes (which in turn offers a third menu of bread, starch (rice, potatoes, other, etc.), and vegetable), and dessert. As the user drills down through these menus, they may reach additional menus providing menu items that correspond to the filters selected in the other second menus (cuisine, dietary restrictions, etc.). In embodiments, dishes may be eliminated according to the filters. In a further embodiment, dishes may include substitutes or eliminations based on the filters, e.g., oil for butter in a no-dairy dish. Each menu item leads to one or more recipe selection execution menus permitting the user to add the recipe to the final meal for preparation. The choices described here are by way of example only, and the meal composition submenu may include additional and/or different menus and hierarchy.

[00624] A wine pairing selection of the first menu offers a user second menu permitting selection of wines to match the selected dishes, e.g., by appetizer, main course, dessert, etc. After selecting a course to which a user will pair wines, execution menus may be provided for a user to actively select wines by varietal, style, label, and other features according to the selected dishes for that course.

[00625] The meal preparation selection of the first menu offers the user a combined walkthrough of meal preparation using the MUI menuing system. The walkthrough provides a series of second menu items including ingredient requirements, make-ahead dishes, and day-of dishes. The ingredient requirements selections provide a shopping list permitting a user to eliminate items they already have. The make-ahead dish menu and day-of dish menu are both similar and allow the user to select between integrated preparation and/or parallel preparation. The make-ahead dish menu offers a user access to preparation steps for all dishes and ingredients that may be prepared ahead of time, while the day-of dish menu provides a user access to preparation steps that are preferably not prepared ahead of time. The parallel preparation menu permits a user access to each selected recipe in its entirety. The integrated preparation menu permits a user access to the recipes in an integrated format. In the integrated preparation menu, a submenu is provided based on timing, e.g., 4 hours prior to meal-time, 3 hours prior to meal-time, 2 hours prior to meal-time, etc. For example, accessing the “4 hours prior” submenu provides the use with a list of tasks to complete 4 hours prior to the meal. The 3 hours prior submenu provides tasks for completion 3 hours prior to the meal, and so on. In this way, the multiple tasks from each recipe can be

combined, for example, if the same ingredient needs chopping for more than one dish and integrated in the most efficient manner possible. In another embodiment, an integrated preparation submenu may be provided with menu items such as start main course, start appetizer, start side dish, complete main course, complete appetizer, complete side dish, etc. Accordingly, a chef's MUI module may permit a user to design a meal and then may provide a full integration of preparation steps.

[00626] In another example, the MUI may be applied to a travel guide, guiding the user through a tour of any geographical region, including, for example, one or more neighborhoods of a city, or intercity travel, or interstate or inter-country travel. Content for the application may include lists of potential destinations, street or road maps, and public transit (e.g., bus, subway or metro, light rail, railroad) maps.

[00627] Destinations may be divided among different categories, including but not limited to points of interest (e.g., museums, monuments, historical sites, parks), dining and drinking establishments (e.g., restaurants and bars), retail establishments, medical facilities, and government offices and stations.

[00628] By way of example, the active menu first prompts the user to identify the current geographical location. Alternatively, through connection of the device to a satellite-based radio navigation system (e.g., GPS), the current location of the user can be automatically inputted. The active menu then asks the user for one or more destinations. It may then ask if the user has a preferred transportation mode, including, for example, walking, driving, or mass transit, while presenting a calculated estimate of time in transit for each such mode of transportation. The MUI then provides the user a route or course, directing the user at each step. In direct workflow mode, the MUI presents the route with the key stops at exchange points. For example, and by way of illustration, the first selection is to start a five block walk from the user's current location (e.g., a hotel) to metro station A. The second selection is to embark on metro train line 1 at station A on the way to metro station B. The third selection is to disembark the metro train line 1 at station B and switch to metro train line 2 on the way to metro station C. The fourth selection is to disembark the metro train line 2 at station C on the way to the bus stop for bus 3 at street intersection D. The fifth selection is to walk two blocks intersection D to board the bus 3. The sixth selection is to disembark the bus at street intersection E. The seventh selection is to walk three blocks from intersection E to the selected destination. These decision points may be tracked for presentation

(e.g., highlighting or positioned for selection) with actual geographic positioning through coordination with a satellite-based radio navigation system. As with other examples provided by the present disclosure, the past selections along the itinerary and/or the future selections to be made are presented at the second portion (or either together in the second portion or separately in second and third portions in an alternative embodiment for displaying both) of the screen, while the active selection is presented in the first portion of the screen. At any point along the directed workflow, the user may select the advanced context menu, which presents the user with a detailed street and/or transit map, capable of zooming in to street-by-street or station-by-station detail, or zooming out for a higher level of detail (e.g., showing major streets and intersections or major and/or transfer stations). The user may then select variations of the direct workflow itinerary, such as diverting from the final 3 block walk to the selected destination and being presented an alternative route to visit an establishment identified on the detailed street map, such as a restaurant to have a meal before visiting the destination, or a convenience store to obtain an umbrella for completing the walk to the selected destination. Additionally, by way of example, the travel itinerary can be limited to fewer modes or even a single mode of transportation, such as a walking tour of an historical district of a city, or be combined with additional modes, such as intercity rail transit.

[00629] In yet another example, a MUI as described herein may be implemented as an operating system or as an overlay to an operating system (OS). The MUI, as described herein, makes user interaction with any system or workflow more efficient by limiting exposure of items that are infrequently used. This design principle and the hierarchical menu flow may be applied, for example, to any aspect of an OS. For example, file tree navigation in Windows, Linux, Apple OS, etc., may be organized as a hierarchical menu tree as described herein, with lesser used options being limited from exposure and moved to a different menu, e.g., an advanced context menu. As discussed herein, lesser used options may refer to options not meeting the threshold percentage of usage frequency, e.g., 70%, 80%, 90%, or any other figure discussed herein. A user, therefore, would only see the file tree options that they interact with the most frequently unless they take steps to view other options. Apps on a mobile device operating system, iOS, Android, etc., may be arranged in the same way. Instead of being presented with multiple screens full of app icons,

as is conventional, the system may categorize a user's app icons and present the apps to a user according to a hierarchical menu tree with limited exposure of lesser used apps.

[00630] In another example, the exposure limiting design principles discussed in accordance with the MUI may be applied to PUSH notifications. In the hierarchical menu trees, menu items that do not meet a threshold percentage of user interaction have their exposure limited. Similarly, push notifications to a user, e.g., alerts and notifications related to text messages, e-mails, app alerts, etc., may be limited based on user interaction. For example, the split of 90% / 10% or 80% / 20% or any other split discussed herein may be applied, where types of push notifications, as characterized, e.g., by sender, subject, recipients, etc., that a user interacts with most frequently are prioritized and other notifications are moved to an auxiliary menu. The push notifications that a user interacts with or accesses 90% of the time or 80% of the time, or any suitable number, may receive prioritized treatment, include vibration alerts, ring alerts, and immediate display. Other push notifications may be collected in a menu accessed only through direct user action.

[00631] In another example, a MUI as described herein may be employed for home design or remodeling. A first menu may permit a user to select a type of room, kitchen, bath, etc., to be remodeled or designed. A second menu may permit a user to select from multiple styles, modern, contemporary, traditional, etc., while a third menu may permit a user to begin selecting individual aspects of the room to be remodeled, i.e., in the case of a kitchen, cabinets, flooring, countertops, etc. In an example such as this, the MUI may interact and/or interface with more conventional design software to build and maintain a model of a user's design as they make selections and develop a design.

[00632] In yet another example, a MUI as described herein may be applied to media content navigation for selecting television programs or movies to watch. For example, a first menu may permit a user to select a category, e.g., genre, release date, popularity, starring actors/actresses, etc., by which they will browse media content. In some embodiments, each successive menu may provide similar options to the first menu, permitting the user to successively filter each next menu. In a MUI applied to media content, exclusion tables may be used, for example, as a content filter to ensure that certain viewers do not have access to inappropriate content. Limitation lists, as discussed herein, may be used to filter and alter menus according to a user's typical viewing habits.

[00633] The following provides additional details in the use of collect and prepare modules and the MUI structure associated with these. In certain embodiments, collect and prepare modules

may be provided for collecting the components of one or more projects, plans, protocols, and/or experiments, and preparing the same to be executed and/or run. In certain embodiments, a collect and prepare module can be used for experiments, e.g., biological, chemical, biochemical, or other scientific experiments. The exemplary, non-limiting embodiments described herein in conjunction with the figures relate to collect and prepare modules for performing assay-based experiments, e.g., kit-based experiments. In certain embodiments, one or more experiments can include the performance of ECL-based assays, although other embodiments are contemplated as well. The collect and prepare modules disclosed herein allow one or more users to identify and collect the necessary components of a particular projects, kits, and/or experiments (Collect mode), and prepare those components in the proper fashion (e.g., perform the necessary steps in a particular and/or proper order) to complete the same (Prepare mode). In both of these modes, users can manually and/or automatically track the completion of their collection and preparation efforts, for example, by selecting the individual components and/or steps via a UI display (or MUI display) to indicate that a particular task has been completed as they proceed through the process. Although the examples provided herein in conjunction with the figures relate to performing biological assays specifically, other applications of this module are contemplated as well, without departing from the scope the disclosure provided herein.

[00634] In certain embodiments, the disclosure provides systems, apparatuses, and methods (for example, executed by a least one processor) for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI) and/or a MUI, as described herein. In some embodiments, these systems, apparatuses, and methods can share one or more features of the systems, apparatuses, and methods as described above, for example, with reference to paragraph [00154] (e.g., the processor (FIG. 56, 1110), storage device (FIG. 56, 1120), display manager (FIG. 56, 1050), input manager (FIG. 56, 1052), etc.). In certain embodiments, the methods disclosed herein can include a step of providing, (e.g., via a processor), a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display (or MUI display). The methods can further include the step of providing (e.g., via a processor), a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display (or MUI display), and a third command for a third menu of one or more user-selectable items to be displayed on a second portion of the UI display (or MUI display). In certain embodiments, both the second and third command can be provided in

response to a user's selection. Further, each of the one or more user-selectable menu items from the second menu can be associated with at least one of the menu items displayed in the second portion of the UI display (or MUI display). Additional details regarding these exemplary methods are described in greater detail below in conjunction with FIGS. 65-72.

[00635] Referring specifically to FIG. 65, UI display 6505 can include a first portion 6510 that can include one or more user-selectable items. In embodiments, UI display 6505 may be a MUI display as described herein. The first portion 6510 may further include a plurality of sub-sections, each with one or more user-selectable menu items. In one embodiment, the first section can be divided into a first sub-section 6515, a second sub-section 6520, and a third sub-section 6525, (although greater or fewer subsections are contemplated as well). The sub-sections can include a first menu of user-selectable menu items including one or more of the following choices: username; email address; experiment identifier 6530; and date of an experiment associated with the experiment identifier 6530 (although additional items are contemplated as well). The embodiment illustrated in this figure includes email addresses (which, in this example, can serve as a user's specific user name), date of experiments associated with one or more experiment identifiers 6530, and experiment identifiers 6530 (as displayed in the first sub-section 6515, second sub-section 6520, and third sub-section 6525, respectively). The UI display 6505 can further include an advanced selector 6540, which is described in greater detail below in conjunction with FIGS. 70-72. The UI display 6505, advanced selector 6540, first menu, and first sub-section 6515, second sub-section 6520, and third sub-sections 6525 are described as described above in conjunction with other embodiments of the disclosure, for example, with reference to paragraph [00481] (e.g., FIG. 38E, elements 381824, 381825, and 381826).

[00636] Using the example depicted in FIG. 65, each of the sub-sections associates a particular user (designated by the user's unique username—here, an email address) with one or more experiments that they have (or others) have previously defined and/or created. The previously defined and/or created experiments can be identified by one or more experiment identifiers 6530, which allow users to uniquely identify and/or label a particular experiment. For example, the experiment identifier 6530 could include a file name or other label for the experiment. In certain embodiments, the experiment itself can be previously defined and/or created through one or more of the other modules described herein. For example, one or more users could use the assay method module (as described above, for example, with reference to paragraphs [00503], [00524], and

[00534]) to create an experiment for the collect and prepare module to operate on. In other embodiments, one or more of the modules and/or methods described herein can be used to create the experiment, assay, project, etc. for the collect and prepare module to operate on.

[00637] In the example depicted in this figure, the experiment identifier 6530 can incorporate at least a portion of the user's user name, along with the date the experiment was created (although other experiment identifiers 6530 are contemplated as well—e.g., a serially assigned identifiers including letters and/or numbers, a coded identifier to allow a user to determine the type of experiment based on the coding of the identifier, etc.). Additionally, the sub-sections can include a date, which can correspond to one or more relevant dates for the associated experiment. For example, the date could be the date the experiment was created, when the creation of the experiment was finalized, when the experiment should be completed by, etc. The association among the individual selections provided within these sub-sections, the manner in which they are arranged on the UI display 6505, the mechanisms for which users can traverse the menu of items, etc. are described above, for example, with reference to paragraphs [00318]–[00320] (referred to as “sub-portions”). By associating these fields, a user can quickly identify and select certain experiments, for example, based on the user, date, and kit name 6560 (as described in greater detail below), etc.

[00638] Moreover, the UI display 6505 can include a filter field 6535, which can allow users to filter these (and additional) fields through various inputs, such as user input through a keyboard or a virtual keyboard, or any other type of user input as described above, for example, with reference to paragraphs [00136], [00476], and [00564]. In certain embodiments, a processor (as described above, for example, with reference to paragraph [00156]) can provide a filter command in response to a selection of the one or more user-selectable menu items from the first menu. This filter command can be adapted to display the filter field 6535 for accepting inputs to filter menu items adapted to be displayed on the UI display 6505. Moreover, one or more processors can issue the filter command for filtering user-selectable menu items in response to user selecting a menu item (such as, for example, by clicking on an item, hovering a cursor over the menu item, etc.). The filter field 6535 can be used, for example, to quickly search for and locate a particular experiment identifier 6530 among a large list of identifiers without the need to manually search through each to locate the desired one.

[00639] FIG. 66 illustrates an embodiment of the UI display 6505 depicted in FIG. 65 for collecting components of an experiment. FIG. 67 illustrates an alternative embodiment of the first portion 6510 depicted in FIG. 66. These figures will be described in conjunction with one another. In addition to the elements discussed in conjunction with FIG. 65, the embodiment depicted in FIG. 66 can include a second portion 6545. The second portion 6545 can include a first set of user-selectable menu items 6550 and a second set of user-selectable menu items 6555. In this example, the second set of user-selectable menu items 6555 can include a sub-menu of the first set of user-selectable menu items 6550. In certain embodiments, the one or more of these menu items can be displayed in the second portion 6545 in response to a selection of an experiment identifier 6530 (or other menu item provided by the UI display 6505) from among the first menu of user-selectable menu items (e.g., as discussed in conjunction with FIG. 65, above). In one example (as depicted in FIG. 66), the second portion 6545 is adapted to display one or more of the following first set of user-selectable menu items 6550: Start; Collect; Prepare; and Confirm, although other examples are contemplated as well. Continuing with this example, each of the menu items available in the first set of user-selectable menu items 6550 can include a sub-menu of menu items made available by the second set of user-selectable menu items 6555. In this example (as depicted in FIG. 66), under the Collect menu item among the first set of user-selectable menu items 6550, the second set of user-selectable menu items 6555 can include the following choices: -80 C; -20 C; 4 C; and Room Temperature (which can range anywhere from between approximately 20–25 degrees Celsius), although other examples are contemplated as well. Similarly, the second portion 6545 is adapted to display one or more these choices in response to a selection of the experiment identifier 6530 discussed in conjunction with FIG. 65, above. In certain embodiments, the one or more menus adapted to be displayed in the second portion 6545 can be collectively referred to as a third menu.

[00640] In the example depicted in FIG. 66, the first portion 6510 includes two sub-sections of user-selectable menu items selected from among the first menu. In this example, the two sub-sections include a first sub-section 6515 and a second sub-section 6520. In certain embodiments, the first sub-section 6515 can include menu items including one or more kit names 6560. The kit name 6560 can include a name of a process, method, sub-experiment, etc. that comprises a particular experiment that corresponds to the selected experiment identifier 6530. For this example, (as depicted in FIG. 66), two kit names 6560 are associated with the selected experiment

identifier 6530: V-PLEX Proinflammatory Panel (human) and PQ Multiplex Test Kit (although greater or fewer kit names 6560 can be associated with any given experiment identifier 6530). Thus, in this example, V-PLEX Proinflammatory Panel (human) and PQ Multiplex Test Kit are kits to be performed (e.g., through the collect and prepare processes described herein) that comprise the previously defined experiment to be performed. In other examples, the kit name 6560 can include one or more of the following: PQ Biotinylated IgG Test Kit; Direct Sandwich Immunoassay with Coating; and Immunogenicity (Q-Plate), etc. In certain embodiments, the kit name 6560 can be used to identify a kit (e.g., one or more components that can be used to carry out a process), which can include, for example, one or more assays (e.g., biomarker assays) to be performed. In other embodiments, kit name 6560 can be used to identify other processes, sub-experiments, methods, etc. that can be carried out as a portion (or the whole) of an experiment, such as a previously designed experiment using one or more of the modules described herein.

[00641] Moreover, the first sub-section 6515 can include a Select All (or alternatively, Check All) choice. In response to the Select All choice, a command can be provided (e.g., by the processor) for selecting all remaining items available in the first sub-section 6515 (although this Select All feature can be applied to other portions of the UI display 6505 as well). For this example, if the Select All choice is selected, both kit names 6560 depicted in FIG. 66 will be selected (e.g., automatically) without the need for the individual selections of each item. The UI display 6505 can further include a selection indicator 6565 to visually indicate whether a selection of a kit name 6560, component, description 6575 of a component, etc. has been made. In the examples provided in FIGS. 66 and 67, the selection indicator 6565 is displayed in both the first sub-section 6515 and second sub-section 6520, although other arrangements are contemplated as well.

[00642] As depicted in these figures, the selection indicator 6565 can include a check box, although other indicators are contemplated as well (e.g., radio buttons, etc.). In the example provided in FIG. 66, the selection indicator 6565 associated with the V-PLEX Proinflammatory Panel (human) kit name 6560 has already been selected as indicated by the mark within the selection indicator 6565. Although a checkmark is used in this example to indicate whether the items has been selected, other indicators are contemplated as well (e.g., dash, X, etc.). In response to selecting the selection indicator 6565 associated with the Select All choice (as depicted in FIG. 66), all remaining items (here, both listed kit names 6560) would be selected and the UI display

6505 would indicate as such by displaying an indicator (e.g., checkmark) in each of the corresponding selection indicators 6565.

[00643] The second sub-section 6520 can include one or more user-selectable menu items as well. As illustrated in FIGS. 66 and 67, the user-selectable items in this sub-section can include representations of various components associated with kit name 6560 (e.g., of the previously defined experiment). Those representations can include, for example, one or more of an image 6570, a description 6575, and a barcode field 6580 associated with the kit name 6560 and/or one or more individual components of a kit. In other examples, components associated with the kit can be displayed as menu items in the first sub-section 6515, although other arrangements of these components are contemplated as well.

[00644] In the context of assay-based experiments, components of a kit can include, assay plates; consumables such as sample input plates, plate lids, pipette tips of various sizes, etc.; biological, chemical, and/or biochemical components such as antibodies, calibrators, controls, diluents, buffers, etc. Thus, for example, if one of the components of a kit includes a diluent, the image 6570 can include a visual representation of that component (e.g., a picture of the diluent) required for that particular kit, and the description 6575 can include a narrative for describing the component represented by the image 6570. The narrative could include the name of the component and/or a brief description 6575 of the same (including, for example, certain characteristics of the component, e.g., the size/volume, what temperature it should be stored, shelf life, etc.). In certain embodiments, the image 6570 can be replaced by and/or supplemented with other visual indicators, such as animated gifs, videos, etc. In certain embodiments, the description 6575 can include one or more of: Decal, Reagent Rack, V-PLEX; Proinflammatory Panel (mouse); Proinflammatory Panel (human); and Human IL-8DA, although other descriptions are contemplated as well.

[00645] The second sub-section 6520 can further include a barcode field 6580, which can be employed to receive a barcode identifier input from one or more of a keyboard, a virtual keyboard, and a barcode reader (or any other input as described above, for example, with reference to paragraphs [00136], [00476], [00563], and [00564]). In certain embodiments, the barcode identifier can be adapted to associate a unique identifier with a component of a kit (e.g., components that include and/or require unique lot number information). In one embodiment, if the component of a kit includes, for example, a read buffer, that component could have a unique barcode affixed to it and available to be scanned to associate that particular component with the

kit. After the barcode is read (e.g., inputted manually through the barcode field 6580 or automatically with another input device, such as a barcode scanner) the selection indicator 6565 can be automatically selected (e.g., by placing a checkbox next to that component) to indicate it has been selected and/or accounted for within the kit. In certain embodiments, the indicator (e.g., checkbox) within the selection indicator 6565 can be color-coded to indicate the manner in which that particular component was selected (e.g., white if manually selected (e.g., mouse click by the user) and blue if selected by scanning that component's barcode, although other schemes are contemplated as well). In certain embodiments, the barcode field 6580 can further include an image 6570 (or animated gif, video, etc.) associated with the component of the kit. For example, the image 6570 could provide a visual indicator as to where the bar code is located on a given component. In other embodiments, the second sub-section 6520 is adapted to display one or more of images and/or descriptions concurrently. For example, as depicted in the embodiment shown in FIG. 67, multiple components (each represented by one or more of an image 6570, description 6575, etc. and associated selection indicator 6565) can be displayed in rows and columns, such as in a grid view to allow users to view and/or select more than one component that is associated with the kit, although other arrangements of these elements are contemplated as well.

[00646] In further embodiments, the barcode identifier can be adapted to encode particular information about the component for which it is associated (also referred to throughout as an "item"), such as identifying a component of a kit or one or more items not necessarily associated with a particular kit (also referred to throughout as an "item"). In a non-limiting, exemplary embodiment, if a barcode is associated with an assay plate, the information encoded by the barcode identifier can be used for one or more purposes, including, but not limited to, uniquely identifying the plate, associating the plate with one or more users, accounts, teams, operators, instruments, etc., associating the plate with one or more experiments, tests, assays, analyses, applications, etc. In embodiments, the associated information encoded in these barcodes can be compared against data stored either locally or remotely. In other examples, an item need not necessarily be associated with any particular user, account, team, operator, instrument, experiment, test, equipment, assay, analysis, application, etc. In these examples, by inputting the barcode (either manually or by scanning, etc.), the user can create an association of that item with one or more experiments, tests, assays, analyses, etc. In other examples, a user can override a previous

association of one or more items with one or more experiments, etc. and re-associate the one or more items with one or more other experiments, assays, analyses or the like.

[00647] Turning to the assay plate example again, if comparison data are stored locally, the encoded information from the barcode identifier can be compared on the instrument that the user is using to read the plate, e.g., in a data store or other computer readable medium either located on the instrument itself or on an additional data store or other computer readable medium (e.g., located within a laptop that is connected (wirelessly or otherwise) to the instrument). Similarly, if the comparison data are stored remotely, the encoded information can be transmitted, e.g., to Cloud Platform (FIG. 50, 503203), from a local location (e.g., on the instrument), compared, and the result of the comparison can be transmitted back to the instrument. In other remote-based examples, the comparison data can be transmitted back to the instrument, allowing the instrument (or an associated computing device, such as a laptop) to perform the comparison. In other local-based examples, local comparison data can be transmitted remotely, compared, and the result can be transmitted back to the instrument or associated computing device. The comparison can occur, for example, by way of a simple string compare, or any other logical comparison function. The information encoded in the barcode identifier can also include a default name for the item (e.g., plate name, Labware type, etc.). Once inputted, the default name of that inputted item can be outputted (e.g., displayed to the user) through, e.g., the UI Display (FIG. 65, 6505). In certain examples, the user can override the item's default name and input a custom name for the item. In other examples, the user cannot modify the originally provided name for the item.

[00648] Continuing with the assay plate example, if the comparison results in a match, one or more events can follow. For example, the comparison could be used to confirm the authenticity of the plate (e.g., confirm that it is not a counterfeit plate), thus allowing the plate to be "unlocked" and read by the instrument. In other examples, the comparison could be used to confirm that that plate is intended to be associated with that particular user, account, team, operator, instrument, experiment, test, assay, analysis, application, etc., for which it was presently selected. In other examples, the comparison can be used to ensure that the selected item is only used once for the purpose it was selected to prevent that user or other users from reusing the item.

[00649] If the comparison results in a match, in certain embodiments, that item (e.g., the plate) can be locked, preventing other users from using that item for any other purpose. In certain examples, after the item has been locked, the user can elect to release the item (e.g., by having that

same user re-input the barcode identifier (e.g., manually, through a barcode scanner, etc.)). The re-inputting could be required to occur within a limited period of time (e.g., within 30 seconds, 2 minutes, etc., although other times greater than or less than are contemplated as well), so as to allow the user to undo input of the barcode identifier if, for example, it was selected in error. In other examples, once locked, the item cannot be released until the item is utilized throughout the process for which it was intended to be used (e.g., in accordance with the Prepare mode, as described in greater detail below). In certain embodiments, if a user attempts to input the barcode identifier of a locked item, an error message could be presented to the user to indicate that the item has already been selected. In other examples, the original user who inputted the barcode identifier for that item could be notified of this subsequent input attempt as well. In other examples, other users could be similarly notified (e.g., one or more team members, the account administrator, etc.).

[00650] In certain embodiments, users could be required to input the barcode identifier (e.g., either manually or with a barcode scanner, etc.) of one or more items, such as, for example, plates, diluents, Labware, etc., so as to prevent users from bypassing this step. Using the assay plate example again, by requiring the inputting of the barcode identifier, the instrument can be configured to lock the plate from being used until the barcode identifier is inputted. This additional step can prevent users from using—either intentionally or unintentionally—an incorrect plate, counterfeit plate, plate for the incorrect experiment, etc. In other examples, this additional safeguard can be eliminated, thereby allowing users to bypass this step by not requiring the user to first input the barcode identifier.

[00651] Turning to the second portion 6545, as described above, this portion can include one or more sets of menu items (e.g., as shown in FIG. 66, a first set of user-selectable menu items 6550 and a second set of user-selectable menu items 6555) provided, for example, as a third menu. Continuing with the assay-related experiment examples provided herein, the menu sets can be uniquely associated with the selected kit. Regarding the first set of user-selectable menu items 6550, for the example shown in FIG. 66, a command can be issued (e.g., by a processor) for selecting the Collect choice by default in response to a selection of the experiment identifier 6530, as depicted, for example, in FIG. 65. A selection of Collect can be used to allow the collect and prepare module to operate in the Collect mode of operation (similarly, a selection of Prepare (as described in greater detail below) can be used to allow the collect and prepare module to operate in the Prepare mode of operation). In this example, the second set of user-selectable menu items

6555 are displayed in the second portion 6545 after the Collect choice was selected by default (although in other examples, users can manually select one or more of the menu items available in the second portion 6545 to traverse the various menus provided). In other embodiments, Collect mode can begin when a user inputs (e.g., scans) the barcode of one or more items, e.g., an assay plate to begin reading that plate on an instrument. Referring to FIG. 66, the Collect choice has been selected as illustrated, for example, in this figure by emphasizing and/or centering the Collect choice in the second portion 6545.

[00652] In certain embodiments, a user can return to a previous menu and/or reset the collect and prepare module, for example, by manually selecting the Start choice to restart the process. In response to a selection of Start, the UI display 6505 is adapted to display a confirmation screen, along with a message asking the user to confirm that they want to start the process over again and/or a warning indicating that by restarting, all previously steps will be reset. The confirmation screen is further adapted to display user-selectable menu items to confirm and/or deny this selection (e.g., by asking the user to select Yes or No). In response to a selection of No, the confirmation screen will no longer be displayed and UI display 6505 will display the previously displayed menu items. In response to a selection of Yes, one or more commands can be provided (e.g., by a processor) to remove previously displayed items from the UI display 6505 and/or display one or more menu items selected from among the choices as described in conjunction with FIG. 65 (e.g., user name, email addresses, dates, experiment identifiers 6530, etc. in the first portion 6510). Further, the second portion 6545 can be adapted to display the Start choice. In certain embodiments, in response to a selection of Yes, only the Start choice is displayed in the second portion 6545 without displaying another other menu items in the second portion 6545.

[00653] Turning to the second portion 6545, in other embodiments, a command can issue (e.g., via a processor) for selecting one of the second set of user-selectable menu items 6555 (e.g., -80 C, -20 C, 4 C, or Room Temperature as shown in FIG. 66) by default. For example, if a user selects a particular experiment identifier 6530 that corresponds to a kit that requires components at one or more of -80, -20, 4, and/or room temperature (e.g., 25 degrees Celsius), one of the corresponding menu items can be selected by default. In response to a selection of one of more of these menu items (e.g., -20 C), the first portion 6510 (e.g., first sub-section 6515) is adapted to display the name of at least one kit associated with the selected experiment identifier 6530, and the second sub-section 6520 is adapted to display one or more of images, descriptions, etc.

associated with components of that kit and further associated with the selection from the second set of user-selectable menu items 6555. Using the Room Temperature choice as an example, in certain embodiments, the components associated with the Room Temperature choice can be displayed in the first sub-section 6515 and include one or more of the following: Blocker Trough; Calibrator 1; Capture Antibody; Capture Antibody Blend Tube; Capture Species Diluent Trough Lid; Control 3; Deep Well Plate; Detection Species Diluent Trough; Diluent Trough; Diluent Plate Lid; Dilution Plate Lid; Maintenance Solution; Blocker A; Read Buffer T; Reagent Rack; Read Buffer Trough; Sample Carrier; Sample Incubation Plate Lid; Streptavidin Plate High Control 1; Test Plate Lid; Tips 1000 ul; Tips 350 ul; Trough Carrier; and Wash Fluid.

[00654] The second set of user-selectable menu items 6555 can include additional items as well and are not necessarily limited to temperature-based options described above. Further, items associated with the second set of user-selectable menu items 6555 in addition to the ones described above can be displayed by the UI display 6505 (e.g., in the first portion 6510 (e.g., first sub-section 6515)), and the particular associated items described herein are provided by way of example only. Further non-limiting examples of suitable items that correspond to one or more of the second set of user-selectable menu items 6555 are provided in Table 1, as shown below. Although the components depicted in this table are classified by assay type (e.g., V-PLEX Assay, U-PLEX Assay) and Temperatures (e.g., Room Temp (~25°C), etc.), the classification of the components provided therein is merely non-limiting and exemplary of certain embodiments. Therefore, each of the components listed in this table can be included in one or more of the various assay types and/or temperatures as well. Moreover, assay types and/or temperatures in addition to and/or in lieu of the ones presented in this table are contemplated as well.

[00655] TABLE 1

V-PLEX Assay Components	
Room Temp (~25°C)	2°C - 8°C
vial	plate (with various antibodies)
tube	antibody (various analytes)
trough	aβ40 blocker
trough lid	aprotinin
pipette tip	control, control 1, 2, 3 (various analytes and panels)
tube rack lid	diluent assembly 9, 15

tube rack base	Various controls
blocker (blocker a)	
buffer (phosphate buffer)	
lyophilization stopper	
read buffer (Read Buffer T, MSD GOLD™ Read Buffer A, MSD GOLD™ Read Buffer B)	
≤-10°C	≤-70°C
diluent (diluent 101, diluent assembly 1, 3, 5, 7, 11, 13, 15, 19, 25)	calibrator stock
	calibrator blend
	control, control 1, 2, 3 (various analytes)
U-PLEX Assay Components	
Room Temp (~25°C)	2°C - 8°C
read buffer (Read Buffer T, MSD GOLD™ Read Buffer)	plate (with various capture reagents)
lyophilization stopper	antibody set (various analytes)
	calibrator stock, calibrator blend (calibrator 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 18, 19, 20, 21, 22; various specific calibrators)
tube rack lid	
tube rack base	diluent (diluent 100)
	Various controls
	aprotinin
	stop solution
	Various linkers
≤-10°C	≤-70°C
diluent (diluent 3, 11, 13, 41, 43, 45, 49, 101)	calibrator stock
	calibrator blend (various analytes; calibrator 16, 23)
blocker d-r	control, control 1, 2, 3 (various analytes)
PQ Assay Components	
Room Temp (~25°C)	2°C - 8°C
read buffer (Read Buffer T, MSD GOLD™ Read Buffer A)	plate (various analytes)
plate pack (e.g., 96-well)	antibody (various analytes)

low count test reagent	calibrator blend (proinflammatory panel 1)
high count test reagent	
tube rack lid	
tube rack base	
trough	
trough lid	
≤-10°C	≤-70°C
diluent (diluent assembly 1)	
S-PLEX Assay Components	
Room Temp (~25°C)	2°C - 8°C
MSD GOLD™ Read Buffer A	plate (with various capture reagents)
tube rack base	antibody (various analytes)
	various calibrators
	diluent (diluent 100)
≤-10°C	≤-70°C
diluent (diluent assembly 21)	
blocker (blocker S1)	

[00656] In certain embodiments, the kit(s) and/or associated components displayed include only those kits and/or components that are associated with that particular selection from the second set of user-selectable menu items 6555 (e.g., by selecting the -20 C item, only kits that require components to be stored at -20 degrees Celsius will be displayed in the first sub-section 6515, and only those components that require -20 degree Celsius storage will be displayed in the second sub-section 6520). In some embodiments, users can manually select menu items from the second set of user-selectable menu items 6555. In response to those manual selections, similarly, the first portion 6510 (e.g., first sub-section 6515 and second sub-section 6520) are adapted to display the name of at least one kit associated with the selected experiment identifier 6530, and the second sub-section 6520 is adapted to display one or more of images, descriptions, etc. associated with components of that kit and further associated with the selection from the second set of user-

selectable menu items 6555. As discussed in greater detail above, in addition the first portion 6510 can be adapted to display a barcode field 6580, additional images, selection indicators 6565, etc. in accordance with those embodiments.

[00657] In certain embodiments, the menu items available among the first and/or second set of user-selectable menu items 6555 can be automatically traversed based on selections from the first portion 6510 (e.g., first sub-section 6515 and/or second sub-section 6520). For example, if the -80 C item is currently selected, after one or more of the user-selectable items have been selected (e.g., by selecting one or more selection indicators 6565 associated with kit names 6560, components, etc. and/or selecting the Select All item), a command can be provided (e.g., via a processor) for selecting another menu item (e.g., -20 C item) within the second set of user-selectable menu items 6555. In certain examples, the command will not be provided until all available kits and/or associated components available from that menu item (e.g., -80 C) have been selected, thus allowing users the opportunity to ensure that they have properly collected all the necessary components related to that kit, before moving on to the next (e.g., -20 C). Similarly, if the -20 C item is currently selected, after one or more of the user-selectable items have been selected (e.g., by selecting one or more selection indicators 6565 associated with kit names 6560, components, etc.), a command can be provided (e.g., via a processor) for selecting another menu item (e.g., 4 C item) within the second set of user-selectable menu items 6555. Similarly, if the 4 C item is currently selected, after one or more of the user-selectable items have been selected (e.g., by selecting one or more selection indicators 6565 associated with kit names 6560, components, etc.), a command can be provided (e.g., via a processor) for selecting another menu item (e.g., Room Temperature item) within the second set of user-selectable menu items 6555. In other embodiments, the order in which these selections occur can vary from the manner described above.

[00658] In a similar fashion, menu items available in the first portion 6510 (e.g., usernames, email addresses, dates, experiment identifiers 6530, kit names 6560, components, etc.) can be automatically traversed as well. This can occur, for example, by providing a command (e.g., via a processor) for traversing one or more items available among the first sub-section 6515 in response to receiving a selection of one of the one or more items. For example, if a user selects a kit name 6560 among a list of available kits, the selector indicator can be selected and in response, another item within that menu of items can be next displayed to the user. For example, using the rotating wheel-based menus as described above, (for example, with reference to paragraph

[00013]), after a particular item has been selected, the selected item can scroll up (or down) so that the next available menu item can be more prominently displayed to the user.

[00659] In certain embodiments, once selections have been made from one or more of the items available in one or more of the second set of user-selectable items, the UI display 6505 is adapted to display a confirmation screen that can include user-selectable menu items including Yes and No. In certain embodiments, confirmation screen can be displayed after one or more selections are made from the Room Temperature choice (or whatever final choice is available from that particular menu level). In this example, the users can traverse each menu item within the second set of user-selectable menu items 6555 until they reach the final menu item within that level before proceeding to the confirmation screen. The confirmation screen can include a message asking the user to confirm that they want to advance the process (e.g., continue to the Prepare process as described (e.g., Prepare mode), for example, as described in conjunction with FIG. 68) and/or a warning indicating that by advancing, all previous steps will be disabled, thus preventing further modification. In response to a selection of No, the confirmation screen will no longer be displayed and UI display 6505 can display the previously displayed menu items. In response to a selection of Yes, a command can be provided (e.g., via a processor) for selecting Prepare (from the second set of user-selectable menu items 6555 in the second portion 6545). Although the previous examples describe a first set of user-selectable menu items 6550 and a second set of user-selectable menu items 6555, greater or fewer sets of menu items (across various hierarchical menu levels) are contemplated as well.

[00660] FIG. 68 illustrates an embodiment of the UI display 6505 depicted in FIG. 65 for preparing an experiment to be run. FIG. 69 illustrates an embodiment of the UI display 6505 depicted in FIG. 68 for confirming completion of the collect and prepare module. These figures will be described in conjunction with one another. In response to a selection of Prepare (as illustrated for example in FIG. 68 by emphasizing and/or centering the Prepare choice in the second portion 6545), the first sub-section 6515 can include one or more instructive steps 6585 for carrying out the kit and the second sub-section 6520 can include one or more of an image 6570 and an instruction associated with the one or more instructive steps 6585. Further, the one more instructive steps 6585 can be associated with a selection indicator 6565 for visually indicating whether a selection of one or more of the instructive steps 6585 has been made.

[00661] The instructive steps 6585 can include a menu of items that provide step-by-step instructions for carrying out the processes within a kit. For example, because V-PLEX Proinflammatory Panel (human) was selected, the instructive steps 6585 can include each of the necessary steps to carry out this kit. In this example, those instructive steps 6585 and include one or more of the following steps: Prepare Shuttle; Thaw Diluents; Label Labware; Reconstitute Calibrator; Reconstitute Controls; Spin Detection Antibodies; Load Detection Antibodies; Place Lid on Assay Plate; Place Assay Plate on Shuttle; Place Lid on Dilution Plate; Place Dilution Plate on Shuttle; Prepare Tube Carrier 1; Place Tube Carrier 1 on Shuttle; Transfer Assay Diluent To Trough; Transfer Read Buffer To Trough; Place Trough Carrier on Shuttle; Mix Calibrator; Load Calibrator; Mix Controls; Load Controls; and Place Reagent Rack on Shuttle, although other instructive steps are contemplated as well. Although in this example, the instructive steps 6585 are arranged in serial order (e.g., providing step number 1, followed by step number 2, and so on), the steps can be arranged in other manners as well (e.g., reverse order, grouped by category, grouped by type of equipment required, by individual needed to perform the step, etc.). In various embodiments, the instructive steps 6585 do not necessarily need to be performed in any particular order. In some embodiments one or more of instructive steps 6585 maybe be repeated, and in other embodiments, each step can be only performed once.

[00662] Instructive steps 6585 in place of (and/or in addition to) the examples provided above are contemplated as well. For example, in one embodiment (e.g., V-PLEX (Type I)), the instructive steps can include one or more of the following steps: Inventory Plates; Prime The Washer; Apply Diluent to Dilution Plate; Apply Blocker to The Plate; Perform Blocking Incubation; Generate Calibration Curve; Create Control Dilutions; Create Sample Dilutions; Wash Assay Plate; Apply Dilutions to Assay Plate; Perform The Sample Incubation; Apply Detection Antibody Blend to Plate; Prepare Detection Antibody Blend; Perform The Detection Incubation; Apply Read Buffer to Plate; and Read Plate. In another embodiment (e.g., V-PLEX (Type II)), the instructive steps can include one or more of the following steps: Inventory Plates; Prime the Washer; Apply Diluent to Dilution Plate; Apply Blocker to the Plate; Perform Blocking Incubation; Generate Calibration Curve; Create Control Dilutions; Create Sample Dilutions; Wash Assay Plate; Apply Detection Antibodies and Dilutions to Plate; Perform Homogeneous Incubation; Prepare Detection Antibody Blend With Blocker; Apply Read Buffer to Plate; and Read Plate.

[00663] In further embodiments (e.g., U-PLEX (multiplex)), the instructive steps can include one or more of the following steps: Inventory Plates; Prime The Washer; Generate Calibration Curve; Create Sample Dilutions; Couple Antibodies to Assay Linkers; Incubate Captures/Linkers; Add Stop Solution to Coupled Antibody Link Solution; Incubate Stop Solution; Prepare Capture Antibody Blend; Apply Capture Antibody Blend to Plate; Incubate Plate with Capture Blend; Wash Assay Plate; Apply Dilutions to Assay Plate; Incubate Plate with Samples; Apply Detection Antibody Blend to Plate; Prepare Detection Antibody Blend; Incubate Plate with Detection Agents; Apply Read Buffer to Plate; and Read Plate. In another embodiment (e.g., U-PLEX (singleplex)), the instructive steps can include one or more of the following steps: Inventory Plates; Prime the Washer; Prepare Capture Antibody Dilution; Apply Capture Antibody Dilution to Plate; Incubate Plate with Capture Dilution; Generate Calibration Curve; Create Sample Dilutions; Wash Assay Plate; Apply Diluent to Assay Plate; Perform Sample Incubation; Prepare Detection Antibody Blend; Apply Detection Antibody Blend to Plate; Perform the Detection Incubation; Apply Read Buffer to Plate; and Read Plate.

[00664] In still further embodiments (e.g., IG Style Assay), the instructive steps can include one or more of the following steps: Create Drug Blend; Apply Drug Blend to Sample Incubation Plate; Create Standard Curve; Create Control Dilutions; Create Sample Dilutions; Apply Block to Plate; Apply Dilution to Sample Incubation Plate; Place Plate on Shaker; Perform Sample Incubation; Remove Plate from Shaker; Return Plate to Hotel; Perform Blocking Incubation; Remove Plate from Hotel; Wash Plate; Apply Incubated Sample to Plate; Perform Test Plate Incubation; Apply Read Buffer to Plate; and Read Plate. In another embodiment (e.g., PK Style Assay), the instructive steps can include one or more of the following steps: Create Standard Curve; Create Control Dilutions; Create Sample Dilutions; Apply Blocker to Test Plate; Place Plate on Shaker; Perform Blocking Incubation; Create Capture Species Dilution; Remove Plate From Shaker; Wash Test Plate; Apply Capture Species to Test Plate; Perform Capture Species Incubation; Apply Dilutions to Test Plate; Perform Sample Incubation; Apply Detection to Test Plate; Perform Detection Species Incubation; Apply Secondary Species to Test Plate; Perform Secondary Species Incubation; Apply Read Buffer; and Read Plate.

[00665] As similarly described above in conjunction with the first sub-section 6515 for the embodiment depicted in FIG. 66, menu items available in in the first portion 6510 (e.g., instructive steps 6585) can be automatically traversed as well. This can occur, for example, by providing a

command (e.g., via a processor) for traversing one or more items available among the first sub-section 6515 in response to receiving a selection of one of the one or more items. For example, if a user selects a particular instructive step (e.g., Thaw Diluents), the selector indicator can be selected and in response, another item (e.g., the next item) within that menu of items (e.g., Place Reagent Rack on Shuttle) can be next presented to the user. Using the rotating wheel-based menus as described above, for example, with reference to paragraph [00013], after a particular item has been selected, the selected item can scroll up (or down, left, right, etc.) so that the next available menu item can be more prominently displayed to the user.

[00666] Turning to the second sub-section 6520, this sub-section can include one or more of an image 6570 and a description 6575. In certain embodiments, the image 6570 can include a visual representation of a component of the selected kit that is associated with one or more of the instructive steps 6585 and the description 6575 could include a narrative for describing an instructive step to perform relating to the component represented by the image 6570. Using the example above, if the instructive step displayed on the first sub-section 6515 included the Prepare Shuttle menu item, the image 6570 could include a photo of the shuttle that should be prepared and the description 6575 could include a narrative regarding the manner in which how the shuttle should be prepared. Other images (or other visual indicators), descriptions, etc. are contemplated as well.

[00667] In certain embodiments, once selections have been made from one or more of the instructive steps 6585 (e.g., when all the selections have been made), the Confirm choice (e.g., displayed in the second portion 6545) is adapted to be automatically selected (as shown, for example in FIG. 69 by emphasizing and/or centering the Confirm choice in the second portion 6545). In other embodiments, the Confirm choice can be selected manually (e.g., by a user). In response to a selection of the Confirm choice, the UI display 6505 is adapted to display a confirmation screen 6590, which can include, for example a Confirm choice. In response to a selection of the Confirm choice, the UI display 6505 is adapted to display user-selectable menu items that includes Yes and No, for example, on the confirmation screen 6590, along with a message asking the user to confirm that they want to complete the process and start over again and/or a warning indicating that the previous kit will no longer be available and/or accessible if the process is confirmed.

[00668] In certain embodiments, in response to a selection of No, the confirmation screen 6590 will no longer be displayed and UI display 6505 will display the previously displayed menu items. In certain other embodiments, in response to a selection of Yes, a command can be provided (e.g., via a processor) to remove previously displayed items from the UI display 6505 and to finalize the kit. Once finalized, in particular embodiments, the kit will no longer be available for selection (e.g., the experiment identifier 6530 and/or kit name 6560 will no longer be made available for selecting the finalized kit and/or experiment). In further response to a selection of Yes, one or more commands can be provided (e.g., by a processor) to remove previously displayed items from the UI display 6505 and/or display one or more menu items selected from among the choices as described in conjunction with FIG. 65 (e.g., user name, email addresses, dates, experiment identifiers 6530, etc. in the first portion 6510). In further embodiments, in response to a selection of Yes, only the Start choice is adapted to displayed in the second portion 6545 without displaying other menu items.

[00669] FIG. 70 illustrates an alternative embodiment of the UI display 6505 depicted in FIG. 65. In certain embodiments, the UI display 6505 can include an advanced selector 6540. In response to a first selection of the advanced selector 6540, the UI display can be adapted to display an advanced context menu 6595 that includes advanced menu choices. In embodiments, the advanced menu choices can include one or more advanced collect and prepare options 65105, including one or more of Show Sample plate layout 65110 and Export Steps while the Collect choice is currently selected. The options available in the advanced context menu 6595 (including the advanced collect and prepare options 65105) can vary depending on which option (e.g., Collect, Prepare, etc.) was selected prior to a selection of the advanced selector 6540. In some embodiments, the advanced context menu 6595 can include choices in addition to the advanced collect and prepare options 65105 (e.g., Software Configuration, User Guides, etc. as shown in FIG. 70). These options can be divided by one or more menu dividers 65100 as illustrated in FIG. 70. The advanced selector 6540, advanced context menu 6595, and menu dividers 65100 are described above, for example, with reference to paragraphs [00306], [00307], and [00487].

[00670] The advanced collect and prepare options 65105 can include one or more advanced options that are made available to a user depending on the particular aspect the user is currently interacting with within the collect and prepare modules. In one example, while in the Collect mode of the collect and prepare module (e.g., by selecting the Collect option displayed in the second

portion 6545), users can export certain data and/or information by selecting the Export Steps choice. In this example, in response to a selection of Export Steps, one or more steps associated a kit that is associated with the selected experiment identifier (FIG. 65, 6530) are adapted to be exported to a file, such as a Microsoft Excel file, a CSV file, Portable Document Format file, etc. Details of exportation are described above, for example, with reference to paragraphs [00493], [00502], and [00567]. In response to a selection of Show Sample plate layout 65110, the UI display is adapted to display a sample plate layout 65110, for example, as depicted in FIG. 70.

[00671] In another example, while in the Prepare mode of the collect and prepare module (e.g., by selecting the Prepare option displayed in the second portion 6545), the advanced collect and prepare options 65105 can include one or more of more of Show Sample plate layout 65110, Show Reagent Rack Layout, and Export Steps while the Prepare choice is currently selected. As similarly described in conjunction with the Collect mode above, in response to a selection of Export Steps under the Prepare mode, one or more steps associated with a kit that is associated with the selected experiment identifier (FIG. 65, 6530) are adapted to be exported to a file, such as an Microsoft Excel file, a CSV file, Portable Document Format file, etc.

[00672] FIG. 71 illustrates an alternative embodiment of the UI display 6505 depicted in FIG. 65 for collecting components of a kit. FIG. 72 illustrates an alternative embodiment of the UI display 6505 depicted in FIG. 65 for preparing an experiment and/or kit to be run. These figures will be described in conjunction with one another. In addition to the advanced context menu 6595 described above, one or more graphs, charts, tables, etc. can be displayed in response to a selection of the advanced selector 6540. For example, (under the Collect or Prepare modes described above), as illustrated in FIG. 71, in response to a selection of Show Sample plate layout 65110, the UI display 6505 is adapted to display a sample plate layout 65110. This example illustrates a 96-well plate that is to be used with an assay-based experiment. In certain embodiments, particular data and/or information can be provided (either through text, coloring coding, etc.) on a well-by-well basis to the user. For example, the sample plate layout 65110 can indicate if an error occurred in one example, or it could provide results of an experiment and/or kit in another. In certain embodiments, as the UI display 6505 displays the sample plate layout 65110, the advanced selector 6540 can be selected again (either when the Collect or Prepare options have been previously selected). In response to a second selection of the advanced selector 6540, the advanced collect

and prepare options 65105 include can one or more of the following options: Export layout image; Copy layout to clipboard; Export as CSV; and Exit sample input plate layout.

[00673] In response to a selection of the Export layout image option, an image of the layout for a particular aspect of the experiment and/or kit (e.g., assay plate layout) can be exported to a file. Further, in response to a selection of the Export copy layout to clipboard option, a layout (e.g., of a plate) can be copied and/or moved (e.g., to cut and pasted) to a separate file, drive, location, etc. In response to a selection of the Export as CSV option, the file to be exported will be formatted as a comma separated value file. These exportation and clipboard functions described above, for example, with reference to paragraphs [00493], [00496], [00502], and [00567]. In response to a selection of the Exit sample input plate layout choice, the UI is adapted to no longer display the sample reagent rack layout. In this example, the UI display 6505 is adapted to display the previously displayed menus and/or menu items to the user before this option was selected.

[00674] In certain embodiments when the Prepare choice was previously selected, in response to a selection of Show Reagent Rack Layout option, the UI display is adapted to display a sample reagent rack layout 65115 as illustrated in FIG. 72. In this example, a graphical representation of reagent rack can be provided that includes information related to one or more of the following aspects of an assay: calibrators, controls, and/or antibodies (e.g., D1–D10), thus providing a graphical representation for each. In certain embodiments, as the UI display 6505 displays the reagent rack layout, the advanced selector 6540 can be selected again. In response to a second selection of the advanced selector 6540, the advanced collect and prepare options 65105 can include an Exit reagent rack layout choice. In response to a selection of the Exit sample input plate layout choice, the UI is adapted to no longer display the sample reagent rack layout. In this example, the UI display 6505 is adapted to display the previously displayed menus and/or menu items to the user before this option was selected.

[00675] In other embodiments, the collect and prepare module can be used to facilitate any other process that requires the gathering and/or collecting of constituent elements of a project (e.g., home projects, cooking, vehicle repair, model building, self-assembly products, self-training, etc.) and preparing them to properly perform and complete the same. Using the home projects example, the collect and prepare module could leverage the collect aspects described herein to inform a home owner as to what materials (e.g., building materials such as wood, drywall, tile, etc.), supplies (e.g., nails, screws, fasteners, etc.), and/or tools (e.g., hammer, power drill, cable stripper, etc.) that are

required to complete the project. Similarly, the prepare aspect of the module can allow the user to properly preform the necessary steps (e.g., first cut the wood, then assemble the building materials, etc.) to complete the project. Other examples and applications are contemplated as well that do not depart from the scope the disclosure provided herein.

[00676] The following provides additional details in the use of assay guide modules and the MUI structure associated with these. In certain embodiments, assay guide modules may incorporate all or a subset of features and aspects of the collect and prepare modules described herein and further provide methods, apparatuses, and systems for processing one or more projects, plans, protocols, and/or experiments that have been previously collected and/or prepared by the collect and prepare modules. In certain embodiments, an assay module may be used for experiments, e.g., biological, chemical, biochemical, or other scientific experiments. The exemplary, non-limiting embodiments described herein in conjunction with the figures relate to assay guide modules for carrying out assay-based experiments, e.g., kit-based experiments. In certain embodiments, one or more experiments may include the performance of ECL-based assays, although other embodiments are contemplated as well. The assay guide modules disclosed herein allow one or more users to process any and all of projects, plans, protocols, and/or experiments performed by the collect and prepare modules. In embodiments, the assay guides modules may include Guided, Self-directed, and/or Manual modes.

[00677] In Guided mode using assay-based experiments as an example, the assay guide modules described herein may provide users with a step-by-step guide to carry out one or more of the necessary steps (e.g., washing, shaking, incubating, reading results, etc.) to complete one or more experiments. In this mode, users may have the flexibility to use any instrument (e.g., ECL-based readers) and/or other equipment and perform necessary experimental steps through a fully guided workflow. Several of the embodiments set forth in the figures (e.g., FIGS. 74-75) illustrate examples of Guided mode. In certain embodiments (for example, those in which assay-based experiments are carried out), Guided mode may be employed in conjunction with a fully automated platform (e.g., one that provides automated instruments and/or other equipment, such as washer, shakers, incubators, etc.). In these embodiments, all necessary steps of a process carried out by the assay guide modules (e.g., pipetting, washing, incubating, shaking, reading, etc.) may be carried out without any human intervention. In other embodiments, in Guided mode, human intervention may be minimized, such as by only requiring users to move assay plates from one piece of

equipment to another (e.g., from a washer to a reader) while all other steps are performed automatically.

[00678] In Self-directed mode, the assay guide modules described herein may provide users more limited guidance and/or instruction throughout the execution of a process, such as a scientific experiment. For example, in this mode, the user may input information relating to an experiment (e.g., scan the barcode of an assay plate) and the assay guide module may provide limited instructions to the users assist them in carrying out steps, or the module may simply provide a checklist for the user to manually navigate to ensure that all process steps completed in the correct order.

[00679] Finally, in Manual mode, users may manually complete processes, such as scientific experiments, etc., by performing the required steps with little-to-no input, commands, and/or instructions from the MUI.

[00680] In certain embodiments, the disclosure provides systems, apparatuses, and methods (for example, executed by a least one processor) for providing guidance through a graphical user interface (GUI) to assist with the completion of one or more steps of a process. The at least one processor may be configured to receive a first command to select an experiment comprising one or more steps to be performed on an instrument or other equipment. The at least one processor may further be configured to provide a second command to display at least a subset of the one or more steps of the experiment on a UI display. The at least one processor may further be configured to provide a third command, to instruct the instrument or other equipment to at least partially carry out the one or more steps of the experiment. Accordingly, the at least one processor may be configured to receive commands related to the selection and specification of an experimental process to be carried out. The at least one processor may be configured to, in response to the received commands, provide commands that result in the display of user instructions for carrying out steps of the experiment and provide commands that result in various laboratory instruments carrying out steps of the experiments.

[00681] Additional details regarding these exemplary methods are described in greater detail below in conjunction with figures (e.g., FIGS. 73–77(a)–(c)). Although the examples provided herein in conjunction with those figures relate to performing biological assays specifically, other applications of this module are contemplated as well (such as for example, at least those

applications provided in conjunction with the collect and prepare module), without departing from the scope the disclosure provided herein.

[00682] FIG. 73 illustrates a laboratory system incorporating a computing system operating with a MUI providing an assay guide module, as described herein. Additional aspects of the assay guide modules described herein will be discussed in conjunction with FIGS. 74-77– (a)–(c), below.

[00683] As shown in FIG. 73, a laboratory system 7300 may include one or more computing devices 7301a-n, one or laboratory instruments and/or equipment 7302a-n, and a network 7304. The one or more computing devices 7301a-n may include, for example, computers, tablets, mobile devices, and/or any other computing device described herein appropriate for operating the MUI software described herein. The laboratory instruments and/or equipment 7302a-n may include, for example, plate readers, plate washers, shakers, incubators, integrated instruments, pipetting systems, and any other laboratory instruments described herein. Communication between the one or more computing devices 7301a-n and the laboratory instruments and/or equipment 7302a-n may be facilitated by a network 7304. The network 7304 may include any appropriate type of wired and/or wireless network, including, for example, cloud based networks, the internet, LAN networks, WiFi networks, Bluetooth networks, and any other appropriate network as described herein. In further embodiments, computing devices 7301a-n may be directly connected, e.g., via wired or wireless connection of any appropriate technology, to the laboratory instruments and/or equipment 7302a-n without the inclusion of a network.

[00684] In certain embodiments (referring, for example, to FIG. 74), the UI display 7305 may be provided through the display of a computing device 7301a-n, such as a computer, tablet, and/or mobile device which is itself is executing the assay guide module. In other embodiments, the assay guide module may be executed remotely from the display. In these embodiments, the UI-display 7305 may be provided through a web-based interface (such as a web browser). In embodiments, for either type of display and/or interface, each instrument and/or other equipment 7302a-n may be accessible only through a unique instance (e.g., each instrument and/or other equipment is accessible through a web browser unique to it) and/or user login such that only one instrument and/or other equipment may be accessed through that login (e.g., requiring that a user log out and back in to access additional instruments, etc.). Using the unique web browser example, each instrument may include a separate tab within a web browser, each with its own unique UI display 7305 for displaying relevant aspects of the assay guide module. In other embodiments, a user may

access more than one instrument and/or other equipment with the same login, through a single web browser, etc. The instruments (e.g., Readers) and other equipment (e.g., washers, shakers, pipetting systems etc.) described herein may refer to standalone instrument and other equipment or partially or fully integrated systems and subsystems comprising two or more of the same.

[00685] In embodiments, the instruments and/or other equipment may be “headless.” For example, headless instruments (or other equipment) may have no (or a very minimal) graphical or command-line user interface. In these examples, these devices (for example an ECL reader) will merely perform an operation, such as a read operation on an assay plate as the plate is loaded onto the instrument (e.g., performing some default function after a assay-plate is brought to it, for example, by a user (or some fully and/or partially automated system and/or subsystem). In embodiments, headless instruments may be used for one or more of connecting an instrument to a user’s intranet, preparing an instrument for normal use, using the instrument in normal use, etc. In other examples, this mode may be used to read an assay plate. In a non-limiting, exemplary embodiment using a headless instrument (e.g., ECL readers), a user may first load a plate on the reader. Next, the assay guide module may assist with instrument’s scanning of the plate’s barcode (either by running a default protocol, a temporary protocol defined by the user directly logged into the instrument computer, and/or a protocol provided specifically for the plate being processed though the assay guide modules). The assay guide module may then export the completed data (e.g., auto-exported) to a user-defined and/or default location.

[00686] In other embodiments (e.g., non-headless embodiments), a computing device, e.g., a tablet, mobile device, and/or laptop, etc. may used to access, control, interface with, etc. one or more of the same either through a web-based interface, wired and/or wireless Ethernet and/or Internet/internet connections, and/or other wireless communication protocols, including NFC, RFID, Bluetooth, etc. In these examples, the device (e.g., tablet) may be used universally to access, control, and/or interface with multiple instruments and/or other equipment. In further non-headless embodiments, one or more computing devices may include a computing device (such as, for example, a laptop) that is specifically dedicated to that instrument and/or other equipment. For example, a laptop computer specifically associated with an ECL-based reader, communicating through a direct interface. In those embodiments, the computing device may communicate in similar manners (wireless and/or wired) as described in accordance with the communication methodologies described above.

[00687] In embodiments, these systems may include automated platforms, for example, fully integrated, one-stop-shop systems such as the Parsec™ R 5000 instrument (P5)—e.g., as disclosed in U.S. Application No. PCT/US2016/043755, filed on July 22, 2016; U.S. Application No. PCT/US2017/014360, filed on January 20, 2017; and U.S. Application No. 63/025,344, filed on May 15, 2020, each of which is incorporated herein by reference. In these examples, the assay modules may work in conjunction with these platform to carry out assay-based experiments with little-to-no human intervention. In other examples, the systems may include partially automated platforms, such as subsystem including two or more of the instruments and/or other equipment that operate in conjunction with the assay guide modules described herein with minimal human intervention while carrying out the processes defined by particular experiments.

[00688] The following embodiments describe examples of an assay guide module operating in Guided mode. FIG. 74 illustrates a UI display consistent with an assay guide module in an embodiment. In this figure a UI display 737305 is illustrated, which provides an interface for a user to interact with while utilizing one or more of the features of the assay guide modules. UI display 7305 may include advanced selector 7340 and a first and second portion (7310 and 7350, respectively). In embodiments, UI display 7305 may be a MUI display as described herein. In certain embodiments, the elements labeled as 73 series elements (e.g., 7305, 7310, etc.) may correspond to the same elements labeled as 65series elements (although additional embodiments are contemplated as well). Thus, for example, the description, embodiments, examples, etc. used to describe UI display 6505 may similarly apply to UI-display 7305 and vice versa.

[00689] In embodiments, the assay guide module may begin by having a user first select a particular experiment to run. This may be performed, for example, by executing one or more of the other modules in accordance with the processes described herein (e.g., by selecting one or more pre-programmed and/or custom-designed experiments, etc.). For example, a user may initiate one or more of the assay method module, experiment module, collect and prepare module, etc. to access and select the experiment the user desires to run within the assay guide module. Using the assay method module as an example, users may select one or more menus of designed experiments by accessing a list of those experiments (e.g., though the advanced selector 7340 to access the assay method module and the first a/or second portions 7310, 7350, respectively, to select the experiment and/or assay to perform). In embodiments, the menu of available experiments may be displayed in various configurations, such as wheel-based menus, vertically stacked menus, and/or

any other menu structure or configuration described throughout. In embodiments users may navigate one or more of these menu and select user-selectable items in accordance with any of the methods described throughout.

[00690] After a user selects the assay to perform, the assay module may begin, for example, in accordance with the processes set forth above in conjunction with the collect and prepare module (e.g., navigating the Collect menu displayed in second portion 7350, followed by navigating the Prepare menu displayed second portion 7350, etc.). Specifically, the Collect menu may provide step-by-step-instructions of what supplies, consumables, equipment, etc. (e.g., assay plates, vials, tubes, read buffers, etc.) must be collected to allow for the successful processing of the selected experiment through the assay guide modules. Similarly, the Prepare menu may provide step-by-step instructions as to the manner in which to prepare the same (e.g., thaw diluents, label Labware, reconstitute calibrators, etc.). The methods, apparatuses, systems described in conjunction with the collect and prepare module are described, for example, in FIGS. 65-72 and paragraphs [0583]-[0625]. Once the collect and prepare steps of the assay guide module are complete, the assay guide module may transition to a Process mode (e.g., after a user select “Confirm” within the Process mode confirmation screen (e.g., FIG. 69, 6590)).

[00691] Continuing with FIG. 74, after the collect and prepare steps are complete, a user may select the Process menu option (displayed, for example, as user-selectable items 7305 within second portion 7350) to process the selected assay. Alternatively, the Process selection may be automatically made for the user (such as, for example, by a processor) after the user has completed the collect and prepare steps described above (e.g., after selecting “Confirm” within the Process mode confirmation screen. In the example illustrated by this figure, the user has already navigated the Collect and Prepare menu (e.g., in accordance with the steps described in conjunction with the collect and prepare module, above) and has moved to Prepare mode (e.g., as shown by the “Process” menu being selected). Continuing with this example, the experiment being processed here is labeled “Assay Method 1,” as shown here as a submenu of the “Process” menu. The second portion 7350 in this embodiment provides the user with an opportunity to make a different experiment selection as needed (e.g., Assay Method n) by traversing the submenu in accordance with one or more of the menu-navigation and item-selection methodologies described herein. The menu options available in this submenu allow users to change assays and/or experiments, select subparts of the selected experiment and/or assay, etc.

[00692] Continuing with the Assay Method 1 experiment selection, after all of the necessary elements of the experiment have been successfully collected and prepared, the first portion 7310 may include a Play Button 7310 (e.g., as similarly shown, for example, FIG. 43C, 432370) to begin the processing steps of the Process mode. In this example, this portion further indicates the total amount of time required to process the selected experiment to completion using a timer, shown in the upper portion of the first portion 7310 in this figure. Upon selection of the Play Button 7310, the timer may begin to count down the amount of time required to complete the experiment (although in other embodiments a stopwatch may count up to indicate how much time has currently elapsed in performing the experiment and/or both a timer and a stopwatch may be provided) and one or more processing steps may begin.

[00693] Referring to FIG. 75, as the process begins (e.g., by a user selecting the play button (FIG. 74, 7310), the first portion 7310 of the UI interface 7305 may include one or more sub portions. Here, three such sub portions are shown: first, second, and third (7315, 7320, 7325, respectively) (although greater and fewer portions may be included as well). In this example, the first portion 7315 may include a list of the tasks/process steps that will need to be performed to carry out this assay, in the order that those steps should be performed, and the time in which the user may expect the process to take.

[00694] In this embodiment, there are only four steps presently displayed (wash plate, add sample, wash plate again, and incubate). The remaining steps from this assay may be accessed, for example, by scrolling the menu to provide the user with a preview of what additional steps are to be performed.

[00695] The settings and/or parameters for the various steps of processes and/or experiments described herein can be selected from preexisting configuration sets (e.g., automatically supplied for a particular experiment), configured by one or users (e.g., with appropriate permissions), and/or recalled from a set previously configured by users. Embodiments of this configuration process are described in greater detail in the examples that follow.

[00696] Using the add sample step as an example, parameters can include the type of fluid (blocker, calibrator, coating, control, diluent, enhanced solution, read buffer, TURBO BOOST antibody, TURBO TAG solution, etc.) and one or more additional, related parameters (for example, its volume—e.g., 5 uL of calibrator). The UI display 7305 can display these parameters, for example, if a series of wheel-based menus (e.g., each in a separate sub-section of the first

portion 7310), each of which can be added, designated, and/or selected accordingly through the users' inputs. Once added, the user can have the option (e.g., displayed in the first portion 7310) to either save the parameter, discard it, or cancel the added parameter and/or process.

[00697] Once the parameters are set, the first section 7310 can display a list of each of the parameters (e.g., types and quantity of liquids, incubation durations, shaker speeds, etc.) so that those parameters and the steps associated with each can be viewed, edited, inserted, moved, and/or removed from the set within the processes and/or experiments. For example, the insert option allows users to insert a step or steps before and/or after a previously established step (conversely the remove option allows users to remove a step or steps from an experiment or other process), and the move option allows for the reordering of those steps from their previously established order. As similarly described above, after manipulating, editing, etc. these steps, users have the option (e.g., displayed in the first portion 7310) to either save these update, discard them, or cancel them.

[00698] In embodiments, additional information and/or settings can be inputted to affect and/or modify various aspects of the more steps carried out by the instruments and/or other equipment. This can be carried out, for example, by having users select (e.g., tapping a touch screen) the step(s) that they wish to modify. For example, if a user taps on the shaker step, parameters, behaviors, and/or configurations can be set that affect and/or impact that step (e.g., duration of shaking, shaker speed, etc.). In some embodiments, users must have appropriate permissions to modify one or more of these parameters, etc. Other experiments may include fewer or greater steps to perform than the example provided here. In addition to the type of step to perform, the approximate amount of time to complete each step may be displayed as well. In this example, each step takes approximately 10 minutes to complete (although other times are contemplated as well). This may allow users to predict and/or schedule times for which the instruments, other equipment and resources etc. will be required to complete the experiment.

[00699] As each of the step completes, certain icons or other graphics may be used to visually indicate the status of each step (e.g., check mark to indicate the step is complete, circular arrows or an hour glass icon to indicate the step is in progress, an "X" to indicate an error, etc., although other visual representations are contemplated as well). In certain examples (such as non-automated embodiments), the user may manually select the status after performing the required manual task (e.g., moving a plate from a washer to a reader) and subsequently select the washing step to indicate

that this step has completed. This may occur, for example, by the user clicking or touching the box shown to the left of the step in this figure, which, in this example, would result in placing a checkbox in the box next to the wash step. The user may further select the read step, which in this example, would cause an in-process indicator (e.g., arrows) to populate the box. Once the read step is complete the user may select this step again, which, in this example, would cause the in-process indicator to transform to a checkbox indicator to indicate that this step has successfully completed. This process may repeat until the entire assay and/or experiment has completed. These (and the other indicators) may be toggled as appropriate through the entire experiment. In other examples (such as semi-automated or fully automated embodiments), as one or more of the assay's steps complete, the status of each may be automatically updated (for example, in real time with little-to-no user interaction) to indicate the progress of each step and of the experiment as a whole.

[00700] As the assay guide module processes each step (either successfully or unsuccessfully), a notification may be provided to the user of the same. Notifications may include, among other things, the name of step, a brief description of the step and/or sub-steps, start/end time, status (e.g., completed, error, etc.). The notifications may take multiple forms including but not limited to text (e.g., SMS configuration), email, computer- and/or mobile-based pop-up alerts, visual and/or audio alerts and/or indicators, etc. In embodiments, they may be provided to users through a dedicated application, such a mobile-device-based app. The notifications may be utilized, for example, to keep users on task, in particular, as each step successfully completes, so as to minimize the delay between steps that require user intervention (e.g., moving plates, pipetting samples, etc.) to complete. In other examples, the notifications may be used to notify additional and/or alternative users, such as, for example, for experiments that require two or more users to perform, each with their own unique assignment of steps, convey error conditions, alert users to the text step(s) to be performed, etc. Additionally, as a particular step processes and/or completes (e.g., a wash step), the UI display 7305 can display what, if any, instruments and/or other equipment are currently available for a user to utilize for this, or any other experiment and/or process. For example, if a first washer was being utilized for a wash step and a second washer was being utilized by another user during that first user's wash step, but that second washer has since completed before and/or at the time of completion of the first washer, the UI display 7305 can display an indication that first and second washers are currently available to one or more users to utilize. This way, users can be automatically notified of resources that have freed up during the utilization of another

resource. In other embodiments, UI display 7305 can display a time estimate as to when the current and/or other resources are expected to be made available at a future point in time (e.g., through one or more steps of an experiment), so as to alert users in advance which resources will be available to them when their experiment is expected to complete their current step and/or reach the next step in its process.

[00701] Moreover, as each step completes, the Audit Trail module, as described in greater detail herein, may be used to record time (e.g., start/stop times, other time stamps, total time, etc.) and status (successfully completed, error, paused, etc.) of each step in the process and the experiment as a whole, the user who assisted with each particular step along the way, etc. In certain embodiments (such as the non-automated one described above), the user's input (such as, for example, the tapping of each step) may be used to track the timing and status aspects whereas with automated systems (semi or fully) the system itself may automatically populate that information. The Audit Trail module in certain embodiments may provide a log of this information that may be exported in various forms, e.g., CSV, xls, etc. In certain embodiments, as one or more steps are in process, other steps may be disabled, thus preventing the user from moving onto a subsequent step before the current step is complete. In embodiments, the users (or a subset of users such as administrators) may manually override this feature.

[00702] As these steps are carried out the timer (and/or stopwatch) may continue to count (down or up as appropriate) until completion. In the example shown in this figure, in addition to the amount of time remaining, the UI display 7305 may indicate if the experiment is running ahead of or behind schedule. For this example, the experiment is running two minutes behind (as indicated by the “-2:00 min” indication within the parenthetical. In other embodiments the UI display 7305 may indicate the experiment is running ahead of schedule (e.g., +3:00 min” indicator) or on time (e.g. “on time” indicator). In embodiments, these indicators may be color-coded for readability, emphasis, etc. (e.g., red for running behind, green for running ahead, etc., although other color schemes are contemplated as well).

[00703] UI Display 7305 may further include second portion 7320 may include one or more images and/or videos 7370 that relates to one or more of the steps (e.g., the current step being processed) or relating to the experiment as a whole. In a non-limiting embodiment, using the wash step as an example, image and/or video 7370 may include an instructional video on how to correctly wash the plate in accordance with this step (e.g., if a user is manually performing the

wash step without an fully or partially automated system to assist). In other examples, image and/or video 7370 may provide the user with a preview of the next step that must be performed after the current step completes. Third portion 7325 may include additional information relating to the current (or previous, subsequent, etc. steps or the experiment as a whole), for example, which equipment is performing that step, what backup equipment is currently available to perform that step, a list of sub-steps contained within that step, etc. This portion may be used, for example, in more complicated and/or time-sensitive steps to provide the user with specific instructions and/or additional information to assist with the successful completion of that step.

[00704] In embodiments, all of the required steps may be assigned to a single user or the various steps may be divided among multiple users. For example, if an experiment spans a shift-change, a user on a first shift may begin the experiment and a user from a second shift may complete the experiment. This reassignment may be performed statically (e.g., pre-designating the two or more individuals responsible for overseeing and/or performing their respective steps) or dynamically, e.g., by allowing the user to manually re-designate one or more responsible users for performing the steps in the experiment that remain. This may be performed, for example, by selecting a menu option (for example in the advanced selector 7340)—e.g., “Assign to other user.” In certain embodiments, only users with certain permissions (e.g., a Lab Manager) may designate/de-designate others and/or be designated/de-designated by others to perform one or more of the steps. By making this selection, the UI interface 7305 may provide a menu (for example on the first portion 7310) of eligible individuals as user-selectable menu items to re-assign one or more of the steps. The menu of available users may be created, modified, deleted, etc. through, for example, admin console as described in greater detail herein. For example, a Lab Manager, accessing the admin console, may set the initial list of users and their level(s) of permissions (e.g., who may designate other users to perform steps, who may be designated to perform steps, etc.). Assuming the user has proper permissions to do so, after the users makes their designation/re-assignment, they may select confirm or cancel the selections, for example by selecting OK or cancel, respectively. Once a selection is made, Process mode may continue by returning back to a display on the UI Display 7305 of the steps required to complete the process. Continuing with the assay-based experiment discussed throughout, the final (or near final) step to complete may include reading the results (e.g., using a ECL-based Reader to obtain the test results at the conclusion of

the experiment). In certain embodiments, that step (including any and all sub steps) may be performed in accordance with the reader module as discussed herein.

[00705] The following embodiments describe examples of an assay guide module operating in Self-directed mode (e.g., as shown in FIG. 76). In Self-directed mode, the MUI may provide and/or receive limited input, commands, and/or instructions to partially guide users through the necessary steps to process an experiment. In this mode, users may use any instrument and/or other equipment through a minimalistic, self-directed workflow. Turning to FIG. 76, in certain examples, to operate the assay guide module in Self-directed mode (or Manual mode), the user must first select which mode to operate in (e.g., using the advanced selector 7340). Using this example, the user may select a menu option, such as “Select Workflow” option 7315, which may provide one or more submenus (not shown) with the option to select which mode to operate this module in (e.g., Guided, Self-directed, manual etc.). In other examples, the user must manually override the Guide mode as a default otherwise the system will operate in Guided mode unless a user selects otherwise. Once the mode is selected (by default or otherwise), the user may access and select a list of experiments, as similarly discussed above in conjunction with the Guided mode above. In other examples, the user may first select the experiment and then select the mode in which to carry that experiment out. In certain examples the mode may be toggled through the processing of a single experiment—e.g., performing some steps in Guided mode, and the rest in Self-directed mode, etc. Although the embodiment depicted in this figure illustrates the advanced context menu 7395 being contemporaneously displayed with other aspects displayed on the UI display 7305 (e.g., 7380 barcode field), in other embodiments, these additional aspects may be displayed only after the advanced context menu 7395 is removed from the display (i.e., such that both are not displayed simultaneously) and vice versa (e.g., in FIG. 74, an advanced context menu (not shown) may be contemporaneously displayed with the aspects illustrated in first portion 7310).

[00706] Once the mode and experiment have been selected (in this example, the user has selected Self-directed mode), the user may manually input information into the MUI to indicate one or more steps are processing and/or completed. For example, in this mode, the UI-display 7305 may include a first portion 7310 that may include a barcode field 7380. This field may be used to either manually receive a user’s inputted barcode for the particular consumable (e.g., assay plate), other equipment, (vials), etc., or receive the barcode in an automated fashion, such as, for example, through a barcode reader. The manner in which the barcode information may be inputted is similar

to the systems, methods, and apparatuses, as described herein in conjunction with the collect and prepare module. Once this information is inputted, the user may manually provide an input to the MUI (such as by clicking, tapping, etc., e.g., a submit command and/or button through the UI display 7305) to indicate that input for that particular step is complete. This process may continue for each plate, consumable, etc. for each instrument or other equipment necessary to carry out the experiment. The information provided then may be routed and/or inputted to one or more of the instruments and/or other equipment necessary to perform the processes for carrying out the selected experiment either all at once or one-by-one as the user enters the relevant information by inputting the relevant barcodes. This may occur, for example, through a server on a web-based platform (e.g., cloud-based platforms) or it may occur through a direct connection, such as through an Ethernet network, direct link between a computing device and the instrument, etc.). In embodiments, a confirmation screen may be provided confirming that the one or more protocols have been received by each instrument and/or piece of equipment needed to complete the experiment. At any time through this process the user may manually abort the experiment and/or its processing steps. As described in conjunction with Guided mode above, the final (or near final) step for this mode may include a read step, which may be executed in accordance with the Reader module description provided herein.

[00707] In Manual mode, a user may manually complete experiments by performing the required steps with little-to-no input, commands, and/or instructions from the MUI. This may include for example, experiments being performed on a Reader or other ECL-based instrument where the user performs each step manually (e.g., user places an assay plate on the Reader, operates the Reader to read the plate, and reviews the data read off the machine, etc. In certain examples, those data may be stored locally, exported, uploaded to a cloud- or web-based platform, etc. The location for which to export the data may be established as default and/or user-selected. Those settings and/or other protocols may be set on a temporary or non-temporary basis on a per-experiment, user, instrument and/or other equipment basis. In other examples, they may be set on a global basis across one or more users, experiments, instruments, etc. In certain embodiments, each instance of a user login may reset one or more of these settings and/or protocols back to a default setting. In other instances, a user may reset one or more of the protocols to the default (or any other defined protocol) by logging out, which cause the one or more protocols to auto-reset to one or more of the defaults. Any data collected while the instrument and/or other equipment was

set to one or more protocols can be exported to one or more export files, in accordance with the descriptions of export data and/or files as described herein.

[00708] Regardless of the mode (Guided, Self-direct, Manual, etc.), at the conclusion of the experiment and/or assay, the user (or other users and/or individuals, such as Lab Managers, Designers, Associates, etc.) may access, analyze, etc. the results using one or more of the additional modules discussed herein. One or more of those individuals may access the results through, for example, one or more modules described throughout, such as, for example, the experiment module, the analysis module, etc.

[00709] In embodiments, the assay guide module may include one or more instrument submodules. The instrument submodules may provide users with the ability to select and configure instruments (and other equipment) relating to the instrument for which the assay guide modules may utilize during processing (e.g., of an assay, experiment, etc.). By using these submodules, users may either manually select or the system may automatically select the specific equipment (e.g., instruments, washers, shakers, incubators, etc.) to use throughout the experiment. After the user selects the instruments required to perform the experiment (or, after that equipment was selected automatically by the processor), users may select the experiment(s) that they want to run. In alternative embodiments, the equipment selection (e.g., manual or automatic) may occur after the user has selected the particular experiment to process.

[00710] Moreover, in these embodiments, users may manually configure these instruments and other equipment. With manual configuration, the configuration may serve as a temporary protocol, which may be utilized while the user is using that particular instrument and/or other equipment (e.g., when a user puts an assay plate on a reader that instrument will perform the read pursuant to the temporary protocol that the user has set (or default if no temporary protocol has been set). In embodiments, once a user logs out of that instrument and/or other equipment, the temporary protocol may be automatically reset back to a default protocol. Various aspects of the instrument submodules, including the selection, configuration, and protocol setting of instruments and/or other equipment, are described in greater detail in conjunction with FIGS. 77(a)–(c), below.

[00711] Continuing with an assay-based experiment example, and with specific reference to these figures, the instrument submodule may be accessed, for example, through the advanced selector 7340 of UI display 735. As shown in this example, various advanced menu options may be made available to a user including, for example the “Instrument” option 7320 in advanced

context menu 7395, as depicted, for example in FIG. 77(a). Further, the advanced context menu 7395 may include a “Set Default Protocol” item 7325, which will be described in greater detail below.

[00712] In response to a user’s selection of the “Instrument” item, a dashboard of instruments (and other equipment, such as washers, shakers, etc.) may be displayed on UI display 7305. With specific reference to FIG. 77(b), the instrument dashboard may be displayed, for example, in first portion 7310 of UI display 735. UI display 7305 may further include a second portion 7345, one or both of first portion 7310 and second portion 7345 may include one or more user-selectable items. The first portion 7310 may further include a plurality of sub-sections, each with one or more user-selectable menu items. In one embodiment, the first section may be divided into a first sub-section 7315, a second sub-section 7320, and a third sub-section 7325, (although greater or fewer subsections are contemplated as well). In embodiments, one or more of the sub-sections may include various instruments and/or other equipment required to carry out an experiment, such as an assay-based experiment. In the example shown in this figure, first sub-section 7315 provides a list of washers, second sub-section 7320 provides a list of shakers, and third sub-section 7325 provides a list of instruments. Within each subsection, user-selectable options may be provided, such as the name of the instrument and/or other equipment (e.g., Washer 1, Shaker 5, Reader 5, etc.) and the status of each (e.g., Ready, Offline, Error, In Use, etc.). Although the user-selectable items illustrated in this figure are shown in a wheel-based menu (as previously described throughout), other menu structures are contemplated as well (e.g., horizontal, vertical, etc.).

[00713] In embodiments, users may access and view lists of equipment that is required to process their experiment. For example, if an experiment requires a single washer, a single shaker, and a single reader, through the MUI, the user may access a list of all available equipment, view the status of each, and select which instruments to use in the experiment. In other examples, this process may be partially and/or fully automated, where a processor may automatically select one or more of the required equipment for the user (for example, washer, shaker, and reader) that has a “Ready” status indicator).

[00714] In addition to the instrument dashboard, the instrument submodules may be used to set default protocols for instruments and other equipment related to the experiment. For example, as depicted in FIG. 77(c), after a user selects the advance selector 7340, the advanced content menu 7395 may include a “Set Default Protocol” menu item 7325 to select. In response to a user’s

selection of this menu item, a submenu of categories of instruments (e.g., readers, etc.) and/or other equipment (e.g., shakers, washers, etc.) may be provided (not shown). Moreover, the first portion 7310 may include a list of the specific instruments or other equipment based on the user's selection of category from this submenu. In the embodiment depicted in this figure, the user has selected Reader as the category for which to set default protocols. In this example, the first portion 7310 displays a list of all readers along with their current status (as described in greater detail above with reference to FIG. 77(a)). From this menu users may set the global protocols for that particular selected instrument (or other equipment) or for the entire group of instrument or other equipment within that category so that the protocol settings may be deployed everywhere (e.g., to each of the instruments that user sets that global protocol for). Protocols may include incubation time, wash and/or shake times, volumes of liquid to dispense, etc. Additional confirmations and/or protocols may include define data export locations, data export formats, etc. Once the protocols are set the user may confirm the same (e.g., by selecting a confirmation button or menu item). Once the protocols have been set and/or transmitted to the affect instrument(s) or other equipment, confirmation may be provided to the user through the UI display 6505 (can be done on the basis of each instrument and/or other equipment or the entire group of the same. In some embodiments, the user will have the ability to abort the setting and transmission of these protocols (such as, for example, selecting "Cancel" menu item or button, etc.) prior to receiving such confirmation. In embodiments, after one or more of the protocols have been set, UI display 7305 can display one or more the instruments and/or other equipment (if any) that either were unable and/or failed to complete the selected protocol update.

[00715] In further embodiments, the instrument submodules may provide users with the ability to set and select default protocols relating to the same. In these embodiments, users have the ability to perform the centralized management of satellite instruments. Moreover, with the default protocol sets, users have may set these default protocols for each instrument (or other equipment) type through a centralized location, which allows the assay guide modules to operate in a streamlined fashion by being automatically configured for the users with little-to-no additional configuration required. Finally, Manual mode and/or Self-directed mode may be associated with the manual configuration and/or protocols described above, and the Guided mode may be associated with the default protocols or vice versa.

[00716] The following provides additional details in the use of three modules: QC Criteria, Project, and Analysis. In embodiments, one or more QC Criteria modules may be provided to establish, recall, refine, modify, and/or edit one or more criteria (as applied to, for example, data-related functions, such as filtering, limiting, truncating, and/or otherwise customizing data sets) to refine the information and/or data that are presented to users through the MUI and the manner in which that information and data are provided. In embodiments, one or more Project modules can provide users with the ability to organize and aggregate one or more experiments (such as, for example, assay-related experiments) to provide users with an efficient, streamlined interface to create, edit, review, and/or organize disparate (or similar) experiments into one or more unified processes controlled, modified, and/or reviewed through the MUI. Finally, in embodiments, one or more Analysis modules can provide users with the ability to quickly review and analyze information and/or data from one or more experiments (e.g., experiments aggregated from the Project modules) to provide users with a process to efficiently review large data sets that highlight and focus data that is most relevant to the users, allowing users to quickly identify data that is most relevant to their experiments and needs. In certain embodiments, one or more of these modules can be provided in a web-based environment, e.g., accessible through a web browser or the like. In other embodiments, one or more of these modules can be provided through programs and/or applications embodied on a storage device, such as a laptop hard drive, physical memory of a mobile device (e.g., phone, tablet), etc.

[00717] For each of these modules, in certain embodiments, the disclosure provides systems, apparatuses, and methods (for example, executed by a least one processor) for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI) and/or a MUI, as described herein. In some embodiments, these systems, apparatuses, and methods can share one or more features of the systems, apparatuses, and methods as described above, for example, as discussed above (e.g., the processor (FIG. 56, 1110), storage device (FIG. 56, 1120), display manager (FIG. 56, 1050), input manager (FIG. 56, 1052), etc.). In certain embodiments, the methods disclosed herein can include a step of providing, (e.g., via a processor), a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display (or MUI display). The methods can further include the step of providing (e.g., via a processor), a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display (or MUI display), and a third command

for a third menu of one or more user-selectable items to be displayed on a second portion of the UI display (or MUI display). In certain embodiments, both the second and third command can be provided in response to a user's selection. Further, each of the one or more user-selectable menu items from the second menu can be associated with at least one of the menu items displayed in the second portion of the UI display (or MUI display). Additional details regarding these exemplary methods are described in greater detail below in conjunction with FIGS. 73 and 78-84.

[00718] The systems, methods, and apparatuses described herein in conjunction with the figures include embodiments for the various modules (e.g., QC Criteria, Project, Analysis, etc.) are described as applied to various applications to assays and assay-related experiments (e.g., ECL-based analysis and experimentation). The description of the specific assays and assay-based processes are provided as examples and are for illustrative purposes only, and the embodiments disclosed herein are not limited thereto. In embodiments, the modules described herein can be applied to other processes and/or applications, including, without limitation, manufacturing, testing, instrumentation, and experimental environments, among other others.

[00719] Turning to the figures, FIG. 73 illustrates a laboratory system incorporating a computing system operating with a MUI providing the modules (e.g., QC Criteria, Project, analysis, etc.), as described herein. Additional aspects of the assay guide modules described herein will be discussed in conjunction with FIGS , 78-84, below.

[00720] As shown in FIG. 73, a laboratory system 7300 may include one or more computing devices 7301a-n, one or laboratory instruments and/or equipment 7302a-n, and a network 7304. The one or more computing devices 7301a-n may include, for example, computers, tablets, mobile devices, and/or any other computing device described herein appropriate for operating the MUI software described herein. The laboratory instruments and/or equipment 7302a-n may include, for example, plate readers, plate washers, shakers, incubators, integrated instruments, pipetting systems, and any other laboratory instruments described herein. Communication between the one or more computing devices 7301a-n and the laboratory instruments and/or equipment 7301a-n may be facilitated by a network 7304. The network 7304 may include any appropriate type of wired and/or wireless network, including, for example, cloud based networks, the internet, LAN networks, Wi-Fi networks, Bluetooth networks, and any other appropriate network as described herein. In further embodiments, computing devices 7301a-n may be directly connected, e.g., via

wired or wireless connection of any appropriate technology, to the laboratory instruments and/or equipment 201-02a-n without the inclusion of a network.

[00721] In certain embodiments (referring, for example, to FIG. 78), the UI display 7805 may be provided through the display of a computing device 7301a-n, such as a computer, tablet, and/or mobile device which is itself is executing the assay guide module. In other embodiments, the assay guide module may be executed remotely from the display. In these embodiments, the UI-display 7805 may be provided through a web-based interface (such as a web browser). In embodiments, for either type of display and/or interface, each instrument and/or other equipment 7302a-n may be accessible only through a unique instance (e.g., each instrument and/or other equipment is accessible through a web browser unique to it) and/or user login such that only one instrument and/or other equipment may be accessed through that login (e.g., requiring that a user log out and back in to access additional instruments, etc.). Using the unique web browser example, each instrument may include a separate tab within a web browser, each with its own unique UI display 7805 for displaying relevant aspects of the assay guide module. In other embodiments, a user may access more than one instrument and/or other equipment with the same login, through a single web browser, etc. The instruments (e.g., Readers) and other equipment (e.g., washers, shakers, pipetting systems etc.) described herein may refer to standalone instrument and other equipment or partially or fully integrated systems and subsystems comprising two or more of the same.

[00722] In embodiments, the instruments and/or other equipment may be “headless.” For example, headless instruments (or other equipment) may have no (or a very minimal) graphical or command-line user interface. In these examples, these devices (for example an ECL reader) will merely perform an operation, such as a read operation on an assay plate as the plate is loaded onto the instrument (e.g., performing some default function after an assay-plate is brought to it, for example, by a user (or some fully and/or partially automated system and/or subsystem). In embodiments, headless instruments may be used for one or more of connecting an instrument to a user’s intranet, preparing an instrument for normal use, using the instrument in normal use, etc. In other examples, this mode may be used to read an assay plate. In a non-limiting, exemplary embodiment using a headless instrument (e.g., ECL readers), a user may first load a plate on the reader. Next, the assay guide module may assist with instrument’s scanning of the plate’s barcode (either by running a default protocol, a temporary protocol defined by the user directly logged into the instrument computer, and/or a protocol provided specifically for the plate being processed

though the assay guide modules). The assay guide module may then export the completed data (e.g., auto-exported) to a user-defined and/or default location.

[00723] In other embodiments (e.g., non-headless embodiments), a computing device, e.g., a tablet, mobile device, and/or laptop, etc. may be used to access, control, interface with, etc. one or more of the same either through a web-based interface, wired and/or wireless Ethernet and/or Internet/internet connections, and/or other wireless communication protocols, including NFC, RFID, Bluetooth, etc. In these examples, the device (e.g., tablet) may be used universally to access, control, and/or interface with multiple instruments and/or other equipment. In further non-headless embodiments, one or more computing devices may include a computing device (such as, for example, a laptop) that is specifically dedicated to that instrument and/or other equipment. For example, a laptop computer specifically associated with an ECL-based reader, communicating through a direct interface. In those embodiments, the computing device may communicate in similar manners (wireless and/or wired) as described in accordance with the communication methodologies described above.

[00724] In embodiments, these systems may include automated platforms, for example, fully integrated, one-stop-shop systems such as the Parsec™ R 5000 instrument (P5)—e.g., as disclosed in International Application No. PCT/US2016/043755, filed on July 22, 2016; International Application No. PCT/US2017/014360, filed on January 20, 2017; International Application PCT/US2021/032565, filed on May 14, 2021, each of which is incorporated herein by reference. In these examples, the assay modules may work in conjunction with these platform to carry out assay-based experiments with little-to-no human intervention. In other examples, the systems may include partially automated platforms, such as subsystem including two or more of the instruments and/or other equipment that operate in conjunction with the assay guide modules described herein with minimal human intervention while carrying out the processes defined by particular experiments.

[00725] In embodiments, the MUI can be applied to and used in conjunction with, various modules, such as the QC Criteria, Project, and Analysis modules as described below.

[00726] The following provides additional details related to the use of QC Criteria modules and the MUI structure associated with them. In certain embodiments, QC Criteria modules may be provided to establish, recall, refine, modify, and/or edit one or more criteria (as applied to, for example, data-related functions, such as filtering, limiting, truncating, and/or otherwise

customizing data sets) to refine what information and/or data are presented to users through the MUI and the manner in which that information and data are provided. For example, through these modules, data limits for various ECL parameters (e.g., Signal %CV, Calc. Calibration) can be limited (e.g., within customizable ranges, upper/lower limits, etc.) to provide fully customizable data to the users to more quickly analyze data related to the assay. These criteria can be stored, for example, as a set rules to be applied against a particular experiment or experiments, and/or later recalled and applied against additional experiments once established. Further examples are illustrated in conjunction with the figures provided herein.

[00727] FIG. 78 illustrates a UI display consistent with an QC Criteria module in a first embodiment. FIG. 79 illustrates a UI display consistent with an QC Criteria module in a second embodiment. These figures will be described in conjunction with one another.

[00728] In certain embodiments, UI display 7805 can include a first portion 7810 that can include one or more user-selectable items. In embodiments, UI display 7805 may be a MUI display as described herein. The first portion 7810 may further include a plurality of sub-sections, each with one or more user-selectable menu items. In an embodiment, the first portion can be divided into a first sub-section 7815, a second sub-section 7820, a third sub-section 7825, and a fourth sub-section 7826 (although greater or fewer subsections are contemplated as well). The UI display 7805 can further include an advanced selector 7840, which is described in greater detail below in conjunction with FIGS. 78-84, and a second portion 7845. The second portion 7845 can include a first set of user-selectable menu items 7850 and a second set of user-selectable menu items 7855. In other embodiments (such as, for example, FIG. 80 described in conjunction with a Project module), a third set of user-selectable menu items 7856 and a fourth set of user-selectable menu items 7857 can be provided (although other numbers of menu levels are contemplated as well). More generally, in certain embodiments, one or more intervening menu levels between menu levels specifically identified and discussed throughout particular embodiments for each of these modules can be provided (e.g., as described in conjunction with the “QC Criteria” menu option described below).

[00729] Moreover, as described throughout this module and the other modules described herein (e.g., Project module, Analysis module, etc.), in embodiments, the selection of menu options and/or user-selectable items can cause a menu and/or user-selectable item to be selected by default. For example, in FIG. 83 (described in greater detail below in conjunction with the Analysis

module), a selection from the first portion 7810 can cause the menu options to be displayed in the second portion 7845 in the manner that those menu options are illustrated in this figure by default (i.e., a first menu item at a first menu level of “Design,” and second menu item at a second menu level of “Experiment,” and a third menu item at a third menu level of “Recent.”). In this example, the “Recent” menu item was selected by the MUI by default in response to a user’s previous selection. In this example, to the extent users wish to select the “Available” menu item, they could make their selection manually after the MUI makes its default selection. The non-limiting, exemplary embodiments described throughout this and the other modules provide examples of particular defaults that the MUI can select as users navigate the menus (for example, the default options are often discussed as the first menu item/user-selectable described following a user’s selection throughout this disclosure). These described defaults, however, are merely provided as non-limiting examples to better illustrate particular embodiments, and other default menus/user-selectable menu items selected by the MUI are contemplated as well.

[00730] Turning back to FIGS. 78 and 79, the UI display 7805, advanced selector 7840, first menu, and first sub-section 7815, second sub-section 7820, and third sub-sections 7825 are similar to or the same as those features having the same name described above in conjunction with other embodiments of the disclosure, for example, with reference to and FIGS. 65-70. Although the fourth sub-section 7826 is not expressly illustrated in these figures, in embodiments, the descriptions of the first through third sub-sections apply equally to the fourth (and fifth, sixth, etc.) sub-sections as well.

[00731] In embodiments, the user can launch the QC Criteria module as option in the advanced context menu 6595, (FIG. 70), which can be accessed through a selection of the advanced selector 7840 (FIG. 78). The advanced selector 7840 and advanced context menus 6595 are described in greater detail throughout. After launching the module (for example, by selecting the module name in the advanced context menu 6595), the first portion 7810 can provide several user-selectable menu items (provided, e.g., in a wheel-based format described throughout, although other menu configurations are contemplated as well). In embodiments, the options can include “Design QC Criteria” and “Review QC Criteria.” The second portion 7845 can include a “START” option, which if selected, can return the user back to the beginning of the module. Notably, this “START” option can be made available as a user-selectable option (e.g., in the second portion 7845) across any of modules described herein and across one or more of the various menus and sub-menus

related to each. In this regard, users can return to the beginning of the selected module throughout one or more of the beginning, intermediate, and/or final menus of a module by selecting this option.

[00732] In response to a selection of the “Design QC Criteria” option, the first portion 7810 can include an additional menu of options include “New” and “From Existing QC Criteria.” Using an ECL-based assay example specifically, a selection of the “New” option can provide the user with the ability to establish new criterion for limiting, excluding, flagging, etc., data generated from emitted ECL signals. Moreover, in response to the “From Existing QC Criteria” option being selected, a user’s selection can be used to recall previously created and saved criterion. Moreover, UI display’s 7805 second portion 7845 can include two hierarchical menu levels—e.g., first set of user-selectable menu items 7850 (e.g., “START”) and a second set of user-selectable menu items 7855 (e.g., “Design”) as illustrated, for example, in FIG. 78.

[00733] In response to a section of the “From Existing QC Criteria,” option, the advanced context menu 6595 can include additional options through a selection of the advanced selector 7840. For example, in response to a selection of the advanced selector 7840 at this particular menu, the advanced context menu 6595 can include the options “Hide QC Criteria,” “Show All QC Criteria,” and “Show Visible Criteria.” In response to a selection of the “Hide QC Criteria” option, the criterion displayed in the first portion 7810 (e.g., as a prominent menu item within a wheel of selectable options, as described in greater detail above) can be hidden from display. In response to this selection, the hidden menu item can still be displayed, but with a label indicating that the criterion is hidden (e.g., by prefacing the option with “(hidden)” to indicated that it is now a hidden item). In response to a selection of the “Show Visible Criteria” option, the hidden criterion or criteria will no longer be displayed in the first portion 7810 because it has been selected to be hidden. When hidden criterion is displayed as a prominent menu item, and the “Show All QC Criteria” option is selected, that criterion can return to its status as a non-hidden criterion (e.g., thus removing the “(hidden)” label). These advanced menu options can be made available under either the “Recent” or “Available” menu options described above. More generally, the advanced context advanced context menu 6595 can be accessed at various points throughout any of the modules described herein (and those described, for example, in U.S. Patent No. 10,936,163, granted March 2, 2021, U.S. Application No. 17/154,377, filed on January 21, 2021, and U.S. Application No. 17/813,720, filed on July 20, 2022, each of which is incorporated herein by reference) to exit the current module and select another. Using the QC Criteria module as an

example, in response to a selection of the advanced selector 7840, other modules (such as the Project modules, Analysis modules, etc.) can be selected as user-selectable items, thereby causing the UI display 7805 to exit the present module and initiate the newly selected module.

[00734] Returning to the first portion 7810 of UI display 7805, in response to a user's selection of the "New" option in the first portion 7810, the UI display 7805 can include multiple sub-sections to allow a user to define one or more of these criterion. Referring specifically to FIG. 79, using an ECL-based assay again as an exemplary embodiment, a first set of user-selectable menu items 7850 within the second portion 7845 can include the "START" and "Design" options described above and the second set of user-selectable menu items 7855 can include "Acceptance Criteria" and "Confirm" options (as illustrated in FIG. 79 in the second portion 7845). In response to a selection of "Acceptance Criteria," a summary of the newly and/or previously defined criteria is displayed, e.g., in the first portion 7810. For example, the first sub-section 7810 can include a summary of the criteria described below (e.g., signal, options for limiting, ranges, flags, etc.).

[00735] In embodiments, in the first portion 7810, first sub-section 7815 can include a list of criteria of ECL-generated signal—e.g., Signal, Adjusted Signal, Signal %, Calc. Concentration, Calc. Conc. %CV, % Recovery, etc. For one or more of these parameters, the second sub-section 7820 can include options for limiting, excluding, including, etc. certain data among the selected criterion—e.g., selecting data less than or equal to a value; greater than or equal to a value, within the range of a value, etc. In embodiments, values can be selected, refined, filtered, etc. by one or more reference values. Using an assay-based example here, reference values can include one or target and/or spec values for a given assay. In this example, the one or more reference values are considered standard values for one or more parameters (for example, Calc. Concentration) as defined for that assay, either by the manufacturer of the consumable and/or through user customization (e.g., as defined through the Assay Method Module as described herein). After a selecting a limiting factor, e.g., "Less than or equal to," the third sub-section 7825 can include an input field that allows a user to input the particular value for that limited parameter. Moreover, a flag-based menu option can be selected within this sub-section, which allows user to either flag or exclude data outside of the user's limited parameters. The "Flag" or "Exclude" option can be provided for user's selection, for example, in the fourth sub-section 7826. For one or more of these selections, for example, as described in conjunction with the checkbox embodiments described

above. Examples of a flag-based menu option is described in greater detail below with reference to FIGS. 85-98

[00736] After the users have inputted their desired selections, those choices can be confirmed by selecting the “Confirm” option in the second set of user-selectable menu items 7855. Once selected, the first portion 7810 can provide a summary of the selection criterion, including the parameter, limitations, flags, etc. as selected through the first through fourth sub-sections described above. Moreover, the first portion 7810 can provide a title for the criterion, allowing the user to store and later recall that criterion. Although a default name can be provided by the MUI, users have the ability through a text field to provide a name for that criterion. Once this process is complete, the user can select a “Confirm” option, as described above. More generally, this “Confirm” option as described herein can be equally applied to any of the modules (QC Criteria, Project, and Analysis) across one or more of the various menus in conjunction with each of those modules. In this regard, the “Confirm” menu option (as provided, for example, in the second portion 7845), can provides with the option to confirm and/or finalize each selection (or a collection of selections) after those choices have been made.

[00737] Returning to the QC Criteria modules specifically, in response to the “Confirm” option, the selected criteria can be saved and/or stored, allowing for it to be recalled, edited, reviewed, and/or applied at a later time at the user’s option, e.g., through a menu option in the first portion 7810, by later selecting the “Review QC Criteria” option described above. In embodiments, the newly established and/or refined QC Criteria can later be applied to previously defined and/or future planned experiments, such as those created, defined, and/or carried out by one or more of the various modules described herein, such as, for example, the Assay Method and/or Experiment Modules.

[00738] In response to a selection of the “Review QC Criteria” option, the first portion 7810 can include a menu of user selectable items that include, for example, previously designed QC criteria projects, e.g., listed by QC criteria project name, and the second portion 7845 include a first set of user-selectable menu items 7850 including “START” and “Review.” In response to a selection of “START,” the user can be returned to a start point of the module as described above (e.g., displaying the “Design QC Criteria” and “Review QC Criteria” menu items in the first portion 7810 of UI display 7805). In certain embodiments, a confirmation screen can be displayed prior to returning to the start point of the module to allow the user first to confirm or cancel whether

they wish to perform this option. The confirmation screen can include, for example, a message asking the user to confirm that they want to start the process over again and/or a warning indicating that by restarting, all previously steps will be reset. The confirmation screen is further adapted to display user-selectable menu items to confirm and/or deny this selection (e.g., by asking the user to select Yes or No). In response to a selection of No, the confirmation screen will no longer be displayed and UI display 7805 will display the previously displayed menu items (or at another previous point and/or the beginning of the module). In response to a selection of Yes, the user's selections can be stored and/or recorded. Although the confirmation screen here is described in conjunction with this particular selection within this particular module, it can be displayed more generally throughout each of the modules described herein and conjunction with various user-selected options and/or inputs throughout each.

[00739] Moreover, the first and second set of user-selectable menu items 7855 can include "Recent" and "Available" options. In embodiments, an intervening menu level between the two can be provided (e.g., providing a "QC Criteria" menu option, for example). Intervening menu items are discussed more generally above. In response to a selection of previously designed QC criteria project, the first portion 7810 can include a summary of the criterion, as described above, for example, after the user selects the "Confirm" option (e.g., the parameter, limitations, flags, etc.). The second portion can include a first set of user-selectable menu items 7850 including "START" and "Review" as described above and the second set of user-selectable menu items 7855 can include a menu of selectable items including "QC Criteria" and "Acceptance Criteria." In response to a selection of "QC Criteria," the UI display 7805 can return to the menu of previously designed QC criteria projects, e.g., listed by QC criteria project name, as described above.

[00740] In response to a selection of "Available" in the second portion 7845, the first portion 7810 can include three sub-sections: the first sub-section 7815 can include one or more user email addresses (identifying, for example, the individual who created the QC Criteria project); the second sub-section 7820 can include a date (e.g., the date the QC Criteria project was created); and the third sub-section can include the name the QC Criteria project name (either default or user inputted). In response to a selection of the QC Criteria project name, the first portion 7810 again can include a summary of the criterion, as described above, for example, after the user selects the "Confirm" option (e.g., the parameter, limitations, flags, etc.), as described in greater detail above.

[00741] In response to a selection of previously designed QC criteria project, the advanced context menu 6595 can include additional options through a selection of the advanced selector 7840. For example, in response to a selection of the advanced selector 7840 at this particular menu, the advanced context menu 6595 can include the options “Hide QC Criteria,” “Show All QC Criteria,” and “Show Visible Criteria,” as described in greater detail above for hiding and/or un-hiding one or more of the criteria (e.g., under either the “Recent” or “Available” menu options in the second portion 7845). In response to a selection of previously designed QC criteria project (e.g., as the first portion 7810 display a summary of the criterion), the advanced context menu 6595 can include the option “Revise QC Criteria.” In response to a selection of this option, the first portion 7810 can display the various options for a criteria (e.g., in three sub-portions with the parameters, limits, values, flags, etc.) as described in greater detail above). Moreover, in response to a selection of the “Revise QC Criteria” option, users can add, modify, delete, etc. one or more parameters, limits, etc. of the previously established criteria. In embodiments, a warning screen can be displayed in the first portion 7810, warning users that this selection create a new QC Criteria revision.

[00742] The following provides additional details related to the use Project modules and the MUI structure associated with them. In certain embodiments, the Project modules provide users with the ability to organize and aggregate one or more experiments (such as, for example, assay-related experiments) to provide users with an efficient, streamlined interface to create, edit, review, and/or organize disparate (or similar) experiments into one or more unified processes controlled, modified, and/or reviewed through the MUI. For example, through these modules, information and/or data relating to one or more previously designed experiments (e.g., designed through the Experiment module, as described in U.S. Patent No. 10,936,163, granted March 2, 2021, can be recalled, aggregated, and/or organized by various parameters (e.g., % recovery, read times, etc.) and displayed to users through the MUI (including for example, tabular data, charts, graphs, etc.). The related projects can be stored, modified, and recalled at a later time (e.g., by incorporating a newly designed experiment into the previous set of projects/experiments) to allow users to quickly organize, aggregate, process, and/or display information and data associated with those experiments in a unified, organized manner. Further examples are illustrated in conjunction with the figures provided herein.

[00743] FIG. 80 illustrates a UI display consistent with a Project module in a first embodiment. FIG. 81 illustrates a UI display consistent with a Project module in a second embodiment. FIG. 82 illustrates a UI display consistent with a Project module in a third embodiment. These figures will be described in conjunction with one another. In certain embodiments, UI display 7805 can include a first portion 7810 that can include one or more user-selectable items.

[00744] In embodiments, the user can launch the Project module as an option in the advanced context menu 6595 (e.g., FIG. 70), which can be accessed through a selection of the advanced selector 7840, as described in greater detail above. After launching the module, the first portion 7810 can provide several user-selectable menu items. In embodiments, the options can include “Design Project” and “Review Project.” The second portion 7845 can include a “START” option, which if selected, can return the user back to the beginning of the module.

[00745] In response to a selection of “Design Project,” the first portion 7810 can display an option to design a new project. In response, to this selection, the second portion 7845 can include various options, such as, for example, those illustrated in FIG. 80 (although other options are contemplated as well). For the specific example provide in this figure, a first set of user-selectable menu items 7850 can include “START” and “Design”; a second set of user-selectable menu items 7855 can include “Setup,” “Sample Set,” “Assays,” and “Confirm”; a third set of user-selectable menu items 7856 can include “Team,” “Description,” and “Parameters”; and a fourth set of user-selectable menu items 7857 can include “Select” and “Members.” In response to a selection of “Description,” a field can be provided (e.g., in the first portion 7810) for a user to enter a project synopsis (e.g., via a keyboard, touchscreen, etc.), allowing for users to provide and obtain a brief synopsis of the project and/or results. In response to a selection of “Parameters,” the first portion 7810 can display user-adjustable parameters, such as the maximum number of plates processed per experiment, for example, by having a user input an integer into a field displayed on that portion.

[00746] In other embodiments, data exporting (such as, for example, plate data) can either be set to a default or customized by one or more users. Using the latter as an example, the Project modules can provide users the ability to export data to one or more locations specific to one or more particular projects, rather than exporting the data either to a default location and/or a location specific to the instrument that read the data from the plate. In this regard, users have the ability to export data to one or more unique locations depending on the particular project or projects, even if some or all of the data are read from a single instrument and/or single geographical location.

Thus, by employing this feature, users can gather and export project data to locations irrespective of where the data were obtained and by what instrument was used to obtain it, thereby allowing users to more effectively store and catalog data based on the particular project or projects it relates to.

[00747] In response to a selection of “Sample Set,” the first portion 7810 provides a user-selectable item, such as a button, to select a sample set for which the Project module to operate on. In response to a user’s selection, one or more files comprising data and/or additional information can be selected and/or imported into the module. The imported data can then be displayed in the first portion 7810, for example, as a table or other format (e.g., a multi-columned matrix with a “Sample ID” column, a column for associated data for each sample row, etc.). File extensions supported include Excel, Word, and/or any other computer application, such as, CSV, tab-delimited text, JSON, XML, and/or any other format. In embodiments, the rows and or columns can be selected to re-sort the data (e.g., by selecting the “Data” column header, the data can be re-sorted from alphabetical to reverse alphabetical, etc.).

[00748] In response to the importation of a sample set, the advanced context menu 6595 can include additional options through a selection of the advanced selector 7840. For example, in response to a selection of the advanced selector 7840 at this particular menu, the advanced context menu 6595 can include the options “Add Sample Set” and “Clear Sample Set.” In response to a selection of “Add Sample Set,” the step above for importing a data can be repeated to allow additional data to be added and/or to replace the other imported data. In response to a selection of the “Clear Sample Set” option, the previously imported data can be deleted, and a new set of data can be imported in accordance with the description for importing data above. In embodiments, a warning screen can be displayed on the first portion 7810 to warn the uses that the data set will be cleared, allowing the selection of “OK” or “Cancel” to either remove the data or terminate that process.

[00749] In response to a selection of “Assays,” the first portion 7810 can include a list of either manual or automated assays, for example, V-PLEX Chemokine Panel 1 (human) Kit, S-PLEX NHP IL-6 Kit, and other assays and/or scientific protocols, such as those described in U.S. Patent Application No. 17/154,377, filed on January 21, 2021. The set of available manual (or automated) assays can be displayed in the first portion 7810 by selecting either a “Manual” or “Automated” set of user-selectable menu items (e.g., third set of user-selectable menu items 7856) in the second

portion 7845. Moreover, the fourth set of user-selectable items 7857 can include “Recent” and Available” user-selectable options in the second portion 7845. In response to a selection of “Recent,” a recent set of available assays (either Manual or Automated depending on the previous selection as described above) can be displayed in the first portion 7810. In response a selection of “Available,” the first portion 7810 can include a first sub-section 7815 that includes various options, such as, including, a list of user names, catalogs, etc. The second portion 7820 can include a list of assay types (e.g., U-PLEX, V-PLEX, etc.), and the third portion 7825 can include the specific assay (e.g., if U-PLEX is selected in the second portion 7820, the third portion 7825 could include the option U-PLEX Adipokine Combo 1 (hu) SECTOR-1 (although other assays, such as those described throughout, for example, are contemplated as well)). Moreover, the first portion can include a filter field 7835 that allows a user’s input (e.g., using a keyboard or touchscreen etc.) to filter by one or more of the fields described above to limited and/or reduce the number of options users scroll through to locate the user-selectable item of their choice. In response to a selection of an assay, the first portion 7810 can include additional information (e.g., data, graphical representation of the assay plate(s) for one or more of the assays provided in the menu of user-selectable item, etc.). In embodiments, this graphical representation can be presented in a horizontal row with a sliding menu, such as the horizontal sliders, as described in greater detail above.

[00750] Although the project modules allow for either the selection of “Manual” or “Automated” processing (such as, for example, processing of assay methods), in embodiments, the Project modules can include projects and/or experimental steps that support both. In this regard, certain steps of a process set forth in a user’s project can be carried out manually, whereas others can be carried out in a semi-automated and/or automated manner, such as by utilizing one or more of the automated platforms described above. In this regard, as users create experiments and associate them with one or more projects, the automated steps across two or more of the experiments can be grouped and/or associated with one another so as to allow the automated platform to perform all (or a subset of) automated steps together. If a user attempts to group incompatible experiments, method steps, projects, etc. together, the Project module can provide an error, notifying the user that those particular automated steps cannot be successfully batched with one another. To that end, users can make modifications to their selections to correct the error, for example, by designating a previously designated automated step to be performed manually.

[00751] In embodiments, the type of experiments and/or the manner in which those experiments are carried out (e.g., manually, semi-automatically, automatically, etc.) can affect the manner in which data and/or information flow between and among the MUI and/or end users, and the instruments and/or other equipment (e.g., washers, shakers, etc.). Using one of the kits described above being run in an automated fashion as an example, the modules described herein (e.g., Project, although the examples provided herein can be equally applicable to one or more of the other modules described throughout) allow for the content and/or options provided to the user to be refined and/or customized based on the specific knowns and/or predefined inputs from the experiments (e.g., amounts of calibrators and/or controls, incubation times, etc.). Thus, for these types of experiments (i.e., those with some degree of definition automatically built-in), the Project module, for example, can use one or more of these predefined inputs to provide to the users (e.g., through the MUI recommendations and/or suggestions) certain tools and/or options to more efficiently carry out those experiments.

[00752] This can be accomplished, for example, by minimizing the number of decisions and/or processing steps needed to executed those experiments to see them through to completion. In this regard, one or more algorithms can be employed to recognize the predefined inputs, causing modifications to the hierarchal menu options and/or other choices offered through the MUI to the end users to streamline the one or more projects the users have selected. In other embodiments, artificial intelligence- (AI) and/or machine learning-based (ML) algorithms can be employed to learn from and/or build off of users' previous projects and/or experiments (and/or one or more discrete steps within a particular experiment) to further refine and improve the flow of content, menus/options, and/or user-selectable items, thus further streamlining the execution of those experiments.

[00753] Turning back to the MUI after a user makes an assay selection, as the first portion 7810 displays the assays and related information as described above (e.g., user names, assay types, specific assays, etc.), in response to a selection of the advanced selector 7840, the advanced context menu 6595 can include options of, for example, "Remove Assay Method" and "Remove All Assay Methods." In response to either of these options, a warning screen can be displayed in the first portion 7810 asking whether the users are sure they wish to remove a particular assay method or all the assay methods, depending on the selected advanced menu option (e.g., asking the user to

“Cancel” or confirm by selecting “OK”). In response to a selection of “Confirm,” the selected assay method(s) will be removed from the user-selectable items in this menu of options.

[00754] In response to a selection of “Setup,” the fourth set of user-selectable menu items 7857 can default to “Members,” in the first portion 7810 can include an option to select members associated with one or more of the projects. For example, individual team members can be selected within the menu of options, or an option can be provided allowing the one or more projects to be open to all team members, team members with certain permissions, etc. In embodiments, if “open to all team members” is selected, in response to a deselection of this option, the first portion 7810 can provide a listing of all team members, allowing the selection and/or deselection of one or more members of that team. In response to a selection of “Select” among the fourth set of user-selectable menu items 7857, the first portion 7810 can include a menu of user-selectable teams. Once a team is selected, again the individual member or members of that team can be selected through the “Members” menu item as described above.

[00755] Finally, in response to a selection of “Confirm,” the first portion 7810 is adapted to display a summary of the project including additional data and information. For example, the Project name, the number of samples, which experiments and/or assays the Project is designed for, etc. Moreover, a field can be provided either to name (e.g., by default) or rename (e.g., by user input) a name for the project. Additionally, a field can be provided for a user to enter a project synopsis, allowing for users to provide and obtain a brief synopsis of the project and/or results, as described in greater detail above.

[00756] In response to a selection of “Review Project,” previously designed projects (e.g., those design in accordance with the description above) can be displayed in the first portion 7810. In embodiments, the second portion 7845 can include “START” and “Review” menu options which, when selected, return the user to the beginning of the module and allow users to navigate the menus and selectable items under the “Review Project” menus respectively. In response to a selection of “Recent” in the second portion 7845, a recent set of available assays (can be displayed in the first portion 7810, as described in greater detail above. In response to a selection of “Available” in the second portion 7845, the first portion 7810 is adapted to display a summary of one or more of the previously designed projects (as described in greater detail above) including additional data and information (e.g., project name, date of creation, version number, etc.). In response to a selection of a particular project (under either of these menu items, which can be selected in response to a

selection, for example, under the “Projects” menu item in the second portion 7845 as described below), the first portion 7810 can include information and/or data about the particular project, e.g., the project name, the number of samples, which experiments and/or assays the project is designed for, etc. The second portion 7845 is adapted to display various additional selectable items including: “Projects,” “Dashboard,” “Results,” “Controls,” and “Charts.” This additional information and/or data can be accessed and/or viewed through “Dashboard” menu item. In response to this selection, the first portion 7810 can include information related to the selected project, for example, the Project name, the number of samples, which experiments and/or assays the Project is designed for, etc. Moreover, in response to a selection of the “Results” menu option, a summary of data related to that project can be displayed in the first portion 7810.

[00757] In response to a selection of the advanced selector 7840 throughout various menus of the module, the advanced context menu 6595 can include additional options. For example, in response to a selection of the advanced selector 7840 at one or more of these menus (e.g., “Dashboard,” “Results,” “Controls,” “Charts,” etc.), advanced menu options can include “Archive,” “Open,” and “Update.” In response to a selection of “Archive,” the particular project (e.g., the project and related information displayed on the first portion 7810) can be archived and removed from the list of previously designed projects. In embodiments, a warning screen can be displayed in the first portion 7810 notifying the user that only authorized users can restore the archived project after it is archived. The first portion 7810 can further display “Cancel” and “OK” options to either confirm or cancel the archive process. When archived, users (such as non-permissioned users) can no longer access and/or view the archived projects. In embodiments, even if archived, users with appropriate permissions (such as, for example, administrators) will still be able to access and/or view the projects that have previously been archived.

[00758] In response to the “Open” option, additional options can be displayed, including “Description,” which allows users to access and modify the project description as described in greater detail above. In response to a selection of “Samples,” the first portion 7810 can display data related to one or more of the selected sample sets, including, for example, tabular data relating to the sample sets. In response to a selection of “Update,” a further selection of “Experiments,” can be selected, which allows users to select a sample set in accordance with the description above, e.g., under the “Sample Set” menu.

[00759] Turning back to the menu options in the second portion 7845 of the UI display 7805, in response to a selection of the “Controls” option, one or more charts can be provided. For example, the first portion 7810 can include a chart with the data provided on a X/Y-graph, including, for example, % Recovery (Linear), % Recovery (Log), etc. on the Y-axis, Read Time on the X-Axis, etc. In embodiments, the axis data (e.g., Y-Axis Log versus Linear) can be toggled through user selection, adjusting the data and/or charts accordingly. The first portion 7810 can further display a control legend to assist the user in reading the chart. Still further, in response to a selection of the “Charts” option, the section portion 7845 can include a “Add” menu item, and the first portion 7810 can include an “Add” option, which, when selected, allows the user to create a new chart or select a previously created chart. For example, in response to the selection of “Add,” the first portion 7810 can include a first sub-section 7820 of the first portion 7815 and a second sub-section 7820. The former can include an option for a user to create a new chart or select the user name of an individual or individuals who previously created a chart. For example, the first sub-section 7815 could include an option of “user1@email.com,” whereby the user with that email address had previously created a chart. In response to a selection of that email address, one or more of the charts previously created by that individual would be available for selection as menu items in the second sub-section 7820. In response to the selection of a “New Chart” menu item in the first sub-section 7815, the user can have the option to select the type of new chart to create in a menu of options available in the second sub-section 7820. Examples of types of charts include: bar charts, box charts, histograms, polar charts, scatter charts, strip charts, etc. In response to a selection of one or more of those charts, a corresponding chart can be provided in various formats, such as, for example, using the basic template form as illustrated in FIG. 82 (although other formats are contemplated as well). In response to a particular chart selection (e.g., Bar Chart) second portion 7845 can include the chart Type (here, “Bar Chart”). The first portion 7810 can include the Chart (78205) and/or the data that comprises the chart. The Chart 78205 can further include a Y-Axis, an X-Axis, a Label, etc. One or more of these can be user-selectable. For example, in response to a selection of the Y-Axis, various parameters can be selected and/or deselected to be included and/or excluded from that axis (e.g., Sample Type, Unknown, etc.). Further, a menu of user-selectable items can be provided in the first portion 7810 (e.g., Cancel, OK, etc.) to cancel and/or confirm the user’s selections, which, in response to a selection of, can return to the user to a display of the selected chart. In response to a selection of “Label,” the user can either input a

label for the chart, and/or select one or more labels displayed in the first portion 7810. Similarly, a menu of user-selectable items can be provided in the first portion 7810 (e.g., Cancel, OK, etc.) to cancel and/or confirm the user's selections, which, in response to a selection of, can return to the user to a display of the selected chart. Finally, a user can return to the list of previously designed projects, for example, by selecting the "Projects" menu item.

[00760] The following provides additional details related to the use Analysis modules and the MUI structure associated with them. In certain embodiments, the Analysis modules provide users with the ability to quickly review and analyze information and/or data from one or more experiments (e.g., experiments aggregated from the Project modules) to provide users with a process to efficiently review large data sets that highlight and focus data that is most relevant to the users, allowing them to quickly identify data that is most relevant to their experiments and needs. For example, through these modules, baseline and/or default analysis criteria could be established and applied against various experiment-based information (e.g., selecting certain attributes that would likely be of interest to one or more users across multiple or all experiments (e.g., age of patients, gender, disease types, etc.)). Once established (e.g., by creating and storing new ones, recalling and modifying previously created ones, etc.), information and/or data most relevant to the user can be quickly displayed and presented to the users through the MUI. For example, in embodiments, the entirety of two or more experiments can be aggregated into a single set that can be collectively reviewed and/or analyzed through a singular analysis in the Analysis modules. In other embodiments, portions of two or more experiments can be similarly aggregated. In this regard, users have the flexibility to select and aggregate discrete portions of two or more experiments (such as, for example, one or more particular plates from each experiment), thus allowing users to manually include and/or exclude portions of the experiment that the Analysis modules analyze. Further examples of the Analysis modules are illustrated in conjunction with the figures provided herein.

[00761] Aggregated data may be associated with one or more similar and/or dissimilar experiments. For example, similar experiments may include experiments having similar conditions, similar procedures, similar samples, and/or similar assays. Data from multiple ones of such similar experiments may be aggregated according to embodiments described herein. Aggregated data may also be associated with one or more dissimilar experiments. Dissimilar experiments may be experiments with differing conditions, procedures, samples, assays, etc. In

further embodiments, aggregated data may include data from one or more experiments including both similarities and dissimilarities (e.g., where a specific aspect of the experiment is varied or made dissimilar while other aspects of the experiment are maintained as similar).

[00762] Among aspects of an experiment that may be considered for similarity / dissimilarity purposes may be the automation level of a processing mode. For example, two experiments may have similar sample types, assays, conditions, etc., but have dissimilar processing modes. For example, in a fully automated processing mode, a fully automated platform (e.g., one that provides automated instruments and/or other equipment, such as washer, shakers, incubators, etc.) may conduct all necessary steps of an experiment. In a partially automated mode, some aspects of the experiment may be carried out by automated equipment while other aspects or procedures are carried out manually. In a manual mode, all steps may be performed manually. Examples of such modes are discussed above with respect to a Guided mode, Self-Directed mode, and Manual mode. These processing modes may be considered to create a dissimilarity between two experiments, even though all other aspects of the two experiments may be similar.

[00763] FIG. 83 illustrates a UI display consistent with an Analysis module in a first embodiment. FIG. 84 illustrates a UI display consistent with an Analysis module in a second embodiment. These figures will be described in conjunction with one another. In certain embodiments, the user can launch the Analysis module as option in the advanced content menu, which can be accessed through a selection of the advanced selector 7840, as described in greater detail above. After launching the module, the first portion 7810 can provide several user-selectable menu items. In embodiments, the options can include “Design Analysis” and “Review Analysis.” The second portion 7845 can include a “START” option, which if selected, can return the user back to the beginning of the module.

[00764] In response to a selection of “Design Analysis,” the first portion 7810 can display menu options that include various experiments including test sample runs. The second portion 7845 can include a first set of user-selectable menu items 7850, including “START” and “Design” and a second set of user-selectable menu items 7855, include “Recent” and “Available.” In embodiments, an intervening menu level between the two can be provided (e.g., providing an “Experiment” menu option, for example).

[00765] In response to a selection of a test sample run, the second set of user-selectable menu items 7855 can include “Experiment,” “Charts,” and “Data.” In response to the “Charts” option

being selected (either by default or by the user), the first portion 7810 can include an option for the user to add a chart. In response to this selection, users can add and/or create charts, for example, in accordance with the description above as it relates the “Charts” selection in the “Project” modules. In response to the “Data” option being selected, the second portion 7845 can include a “Table” and “Plates” Options (e.g., in the third set of user-selectable menu items 7856). In response to the “Table” option being selected, the first portion 7810 can include one or more data sets, for example, in a tabular format for that particular experiment and/or test sample run. Data fields can include: plate name, plate barcode, sample set, sample index, sample name, assay type, well location, spot number, dilution, concentration, unit of concentration, signal, adjusted signal, signal mean, signal CV, calc. concentration, calc. concentration mean, calc. concentration CV, detection range, % recovery, % recovery mean, and/or any parameters that have been excluded and/or flagged, etc. In response to the “Plates” option being selected, a visual representation of one or more assay plates can be provided in the first portion 7810, along with additional information (e.g., name of the experiment and/or sample run, total number of samples, name of assay, barcode ID, read time and/or date, etc.).

[00766] Under the “Charts” selection described above, in response to a first selection of the advanced selector 7840, the UI display can be adapted to display an advanced context menu 6595 that includes one or more advanced menu choices. For example, in response to a selection of “Charts,” the advanced context menu 6595 can include the option of “Save Analysis,” which can allow save the analysis to a file that can later be recalled. In embodiments, as one or more charts are being displayed by the UI display, in response to a selection of the advanced selector 7840, the advanced context menu 6595 can include one or more options, including “Save” and “Cancel.” Under the “Data” selection described above, in response to a first selection of the advanced selector 7840, the UI display can be adapted to display an advanced context menu 6595 that includes one or more advanced menu choices. For example, in response to a selection of “Data,” the advanced context menu 6595 can include the options of “Save Analysis,” (ether under the “Table” or “Data” menus described above, which allows users to save the analysis data to be recalled at a later time. Under the “Table” menu described above, a selection of the advanced context menu 6595 can provide several options including: “Export Data Table,” which allows users to export data to a file, such as, for example, an Excel, Word, and/or any other computer application, such as, CSV, tab-delimited text, JSON, XML, and/or any other format; and “Enable Search,” which allows users to

search one or more fields within the data set. For the latter, in response to the “Enable Search” selection, the first portion 7810 can display a search keyword field, allowing users to type in their search criteria. The resulting search can display a subset of the data that match the searched criteria.

[00767] In response to the “Experiment” option being selected, the second portion 7845 can include “Recent” and “Available” menu items, for example, in the third set of user-selectable menu items 7856. In response to a selection of “Recent,” a recent set of experiments and/or test sample runs can be provided in the first portion 7810. By selecting an experiment and/or test sample run, the second set of user-selectable menu items 7855 can include “Experiment,” “Charts,” and “Data” as described above. In response to the “Available” menu option, a set of available experiments and/or sample test runs can be displayed in the first portion 7810. In embodiments, these can be displayed in three sub-sections, for example, the first sub-section 7815 can include a list of user names; the second sub-section 7820 can include a list dates for which the particular experiment and/or sample test run occurred, and the third sub-section 7825 can include the name of the experiment and/or sample test run. By selecting an experiment and/or test sample run, the second set of user-selectable menu items 7855 can include “Experiment,” “Charts,” and “Data” as described above.

[00768] In response to a selection of “Review Analysis,” the second portion 7845 can include “Recent” and “Available” menu items, for example, in the third set of user-selectable menu items 7856. In embodiments, the second portion 7845 can include “START” and “Review” menu options which, when selected, return the user to the beginning of the module and allow users to navigate the menus and selectable items under the “Review Analysis” menus, respectively. In response to a selection of “Recent,” a recent set of experiments and/or test sample runs can be provided in the first portion 7810. By selecting an experiment and/or test sample run, the second set of user-selectable menu items 7855 can include “Analysis,” “Charts,” and “Data” menu items. In response to the “Available” menu option, a set of available experiments and/or sample test runs can be displayed in the first portion 7810. In embodiments, these can be displayed in three sub-sections, for example, the first sub-section 7815 can include a list of user names; the second sub-section 7820 can include a list dates for which the particular experiment and/or sample test run occurred, and the third sub-section 7825 can include the name of the experiment and/or sample test run. By selecting an experiment and/or test sample run, the second set of user-selectable menu items 7855 can include “Analysis,” “Charts,” and “Data” as described above.

[00769] In response to the “Charts” menu item being selected, the first portion 7810 can include user-selectable items, such as parameters, one or more of which can be included on a chart. For example, the parameters can include: Calibrators, Sample Signal, Sample Concentration, Control % Recovery, Adjusted Signal v. Adjusted Signal, etc. Moreover, the user-selectable items can include an add option, which, when selected can allow users to add new charts, such as, for example, bar charts, box charts, histograms, polar charts, scatter charts, strip charts, and/or one or more of the charts described above in conjunction with the Project module.

[00770] In response to a selection of a parameter, (e.g., Calibrators), the first portion 7810 can include a chart of, e.g., Concentration (Log) (on the X-Axis) for that select experiment and/or sample test run, plotted against, e.g., Signal (Log), (e.g., on the Y-Axis), etc. An example of a basic format of a chart in an embodiment is illustrated, for example, in FIG. 82 in conjunction with the Project module. In certain embodiments, more than a one chart can be provided, e.g., one chart for every detected protein, cytokine, etc. in the test sample.

[00771] The second portion 7845 can include additional user-selectable menu items as the one or more charts are concurrently displayed on the first portion 7810. For example, the third set of user-selectable menu items 7856 can include the remaining parameters discussed above, e.g., Control % Recovery, Adjusted Signal v. Adjusted Signal, the add function described above, etc. In response to one or more of those menu items, similar charts can be generated and displayed on the first portion 7810 (e.g., in response to Adjusted Signal v. Calculated Concentration (Scatters), one or more scatter charts can be provided plotting, e.g., the Adjust Signal (Linear) on the X-Axis versus the, e.g., Calculated Concentration (Linear) on the Y-Axis). Additional aspects described above in conjunction with the description of the Project module, for example, can be displayed as well, e.g., Assay legends, titles, etc.

[00772] In response to a selection of “Data” option being selected, the second portion 7845 can include a “Table” and “Plates” Options (e.g., in the third set of user-selectable menu items 7856). In response to the “Table” option being selected, the first portion 7810 can include one or more data sets, for example, in a tabular format for that particular experiment and/or test sample run. Data fields can include: plate name, plate barcode, sample set, sample index, sample name, assay type, well location, spot number, dilution, concentration, unit of concentration, signal, adjusted signal, signal mean, signal CV, calc. concentration, calc. concentration mean, calc. concentration CV, detection range, % recovery, % recovery mean, and any parameters that have been excluded

and/or flagged, etc. In response to the “Plates” option being selected, a visual representation of one or more assay plates can be provided in the first portion 7810 (e.g., FIG. 84, 78210), along with additional information (e.g., name of the experiment and/or sample run, total number of samples, name of assay, barcode ID, read time and/or date, etc.).

[00773] In response to a selection of “Analysis,” the first portion 7810 can return to the include “Recent” and “Available” menu items, for example, in the third set of user-selectable menu items 7856, as described in greater detail above. As described in greater detail above in conjunction with the “Design Analysis” menus and submenus, in response to a selection of the advanced selector 7840, the UI display can be adapted to display an advanced context menu 6595, containing various advanced selection options. By way of example, the advanced options described in conjunction with the “Design Analysis” menus can apply equally to the “Review Analysis” options as well. For example, under “Charts,” while a chart is being displayed by the UI display, a “Save Analysis” options can be provided in the advanced context menu 6595. Similarly, under the “Data” menu, the advanced context menu 6595 can include the “Export Data” and “Enable Search” options as described above.

[00774] In additional embodiments, the Analysis module can include one or more Design Analysis submodules. As the Analysis module itself, these submodules can be provided, for example, in a web-based environments, e.g., accessible through a web browser or the like. In other embodiments, one or more of these modules can be provided through programs and/or application embodied on a storage device, such as a laptop hard drive, physical memory of a mobile device (e.g., phone, tablet), etc.

[00775] In embodiments, a user can select the Design Analysis Settings submodule through the advanced selector 7840 (e.g., by choosing an “Analysis Settings” option in the advanced context menu 6595. In response to this selection, the first portion 7810 can include the option of “Design Analysis Settings.” In response to a selection of this menu item, the second portion 7845 can include an “Analysis Settings” menu with a “Recent” and “Available” menu options (for example, in the third set of user selectable menu items (e.g., FIG. 80, 7856). In response to a selection of the “Recent” menu, the first portion 7810 can include a list of parameters (e.g., LogLog, Linear, Exponential, 5PL, 4PL, etc.) to configure. In response to one or more of these parameters, various additional aspects of the selected parameter can be further configured, each of which can be

selected and configured as menu items in the second portion 7845. Those aspects can include, for example, Calibration Curves, Background Corrections, Limitations of Detection, etc.

[00776] For the Calibration Curves, the first sub-sections 7815 can include a type, e.g., algorithms, weighting factors, input signals, replicates, etc., and the second and/or third sub-sections 7820 and 7825, respectively, can include a selection for each. For example, the algorithms can include 4PL, 5PL, exponential, linear, loglog, options, etc.; weighing factors can include $1/y$, $1/y^2$, none options, etc.; input signal can include raw or corrected options; and replicates can include averaged or individual options. Under this menu selection, in response to selection of the advanced selector 7840, the UI display can be adapted to display an advanced context menu 6595 with the option of “Define Fit Parameters,” which, when selected, allows users to define and/or refine particular parameters, (e.g., Hill Slope, Y-Intercepts, etc.). Once defined, in response to a selection of the advanced selector 7840, further advanced options include “Save Parameters” and “Cancel Changes,” to cause the parameters to be saved or canceled, respectively.

[00777] For Background Correction, the first sub-section 7815 can include calibrator, control, and sample (all of which can each include corresponding second sub-sections that include associated choices including none, subject, divides, etc. for each of these options. Finally, for Limits of Detection, upper and/or lower limits can be set based, for example, on standard deviation values and percent of counts. Limits can also be set below the highest calibrator and/or above the lowest calibrator, etc. In certain embodiments these limits can be set and displayed in the first section 7810 across multiple subsections (e.g., limit (upper or lower), limiting value, type of limit (e.g., standard deviation, percent counts, etc.); limit type (e.g., below highest or above lowest) and the limit factor (e.g., standard deviations or percent counts)). In some embodiments, the type of limit displayed and further selected and/or modified in a fifth subsection (not shown) in response to one or more of the options displayed in the remaining subsections. Once the users have made their selections the “Confirm” option can be selected, for example, in the second portion 7845. Under the “Limits of Detection” option, in response to selection of the advanced selector 7840, the UI display can be adapted to display an advanced context menu 6595 with the option of “Enable Minimum Error Estimates” option which, when selected, enables this option by minimizing error in the estimated values. This feature can be used to calculate limits of detection, depending on the particular instrument (e.g., ECL reader) and or consumable (e.g., plate type) that are carrying out an experiment. In this regard, the Minimum Error Estimate can factor in the limits of a particular

instrument (e.g., when reading very high or very low ECL measurements) when calculating these limits of detection. In response to a subsequent selection of the advanced selector 7840, the advanced options can include disabling this feature, thus allowing a user, for example, to toggle between these two options.

[00778] In response to the “Available” options, previously defined limits (as described in accordance with the previous discussion) can be recalled and modified through the processes described above. In certain embodiments, in response to the selection of “Available,” those previously defined limits can be displayed on the first portion 7810 across multiple sub-sections that include, for example, user name (e.g., first sub-section 7815); type of related experiment (e.g., immunoassay (e.g., second sub-section 7820), and name of limit (e.g., third sub-section 7825)).

[00779] Under the “Recent” selection described above, in response to a first selection of the advanced selector 7840, the UI display can be adapted to display an advanced context menu 6595 that includes one or more advanced menu choices. For example, the advanced context menu 6595 can include the options of “Hide Analysis Setting” and “Show All Analysis Settings.” In this regard, one or more Analysis Settings created, modified, and/or stored throughout the processes described above, can be hidden, filtered, and/or made visible in a similar manner as described above in conjunction with the QC Criteria module described above used to hid, show all, and show visible criteria (e.g., the Hide QC Criteria,” “Show All QC Criteria,” and “Show Visible Criteria” options described in conjunction with that section).

[00780] Now referring to FIGS. 85-98, an example UI display 8000 for displaying aggregated results of a project having a plurality of experiments is illustrated. The UI display 8000 may be representative of the displays or GUIs discussed above. That is, any one of the displays or GUIs discussed above provide the same functionality as the UI display 8000.

[00781] Using the UI display 8000, a user may quickly and easily: (1) review data; (2) select data to exclude from the analysis, for example, because the data is identified as spurious, anomalous, or otherwise undesirable; (3) add a new assay, sample, and/or experiment to a project; and/or (4) flag results corresponding to an assay and/or sample. In some implementations, a processor may flag the results based on a quality criterion and flag samples and/or assays that correspond to the flagged results, for example, through one or more criterion derived from and/or based off of the QC Criteria modules. The flagged results may indicate samples and/or assays that are to be rerun or repeated. The samples/assays that are rerun may be added to a particular project

(comprising one or more experiments) as a new experiment and/or appended to an existing experiment. That is, the project may include one or more experiments completed at a first time, one or more new experiments, one or more modified experiments, and/or one or more rerun experiments. The one or more of these experiment types may be completed and the results added to the project after an original set of experiments have been ran or completed.

[00782] FIG. 85 illustrates the UI display 8000 displaying a dashboard of a particular project having two experiments 8100. Each experiment 8100 includes data corresponding to one or more kits having a plurality of samples and analytes for performing assays. In some implementations, each kit may correspond to a container. For example, the sample container may be a multi-well plate wherein each well has a plurality of spots to perform one or more assays on one or more samples. In the depicted embodiment, the data from a first experiment 8102 correspond to five multi-well plates, each plate containing about 40 samples for performing one or more assays, although greater or smaller sample sizes are contemplated as well. Meanwhile, data from a second experiment 8104 correspond to two multi-well plates, each having 40 samples for performing multiple assay. The data may include results corresponding to a completed experiment and/or assay parameters for one or more assays to be performed. A “Results” menu item may be selected to display a more detailed view of the data.

[00783] Referring to FIG. 86, the UI display 8000 is depicted with the “Results” menu item selected. The “Results” view aggregates data corresponding to one or more experiments of a particular project. The “Results” view lists a sample ID in a first column and corresponding signal results for each assay performed on that corresponding sample. For example, a sample corresponding to a sample ID may be disposed in a sample container for testing for analyte via an assay. In some implementations, samples corresponding to the same sample ID may be disposed in a plurality of sample containers for testing for different analytes using one or more assays. For example, the sample ID may correspond to a particular biological sample type (e.g., blood, urine, etc.) and portions of the particular biological sample may be disposed in a plurality of containers (e.g., spots, wells, multi-well plates, etc.) for conducting one or more assays to detect one or more analytes. From the “Results” view, a user may quickly and easily analyze the data, determine whether results for a particular sample, assay, spot, well, multi-well plate and/or reactant are to be excluded (e.g., due to such results being spurious and/or anomalous and/or otherwise undesirable). In some implementations, a user may manually mark a result for exclusion from the data analysis,

and/or for rerunning the sample at a later time. In other embodiments, rules and/or criteria can be applied against the data without the need for manual intervention (such as, for example, the processor automatically running preset rules and/or parameters for flagging and/or excluding data that are outside one or more of those parameters). The result data may also be charted to assist in analyzing the data.

[00784] Now referring to FIG. 87, the UI display 8000 is depicted with the “Charts” menu item selected. In the depicted embodiment, charts corresponding to the aggregated data are displayed. Each chart corresponds to a particular plate of one or more well plates, and is labeled with a barcode for the particular plate. Each well of the well plate includes 10 spots for testing a sample for different analytes using 10 assays, although other numbers of spots and/or samples are contemplated as well. In this example, the X-axis is labeled with the particular assays under which the samples are being tested, and corresponds to a spot within the well. The Y-axis corresponds to a response signal (e.g., signal mean) from the particular assay across all samples and across all wells on all plates. In the depicted embodiment, the bar charts display assays vs. signal means (e.g., mean value of signal response); however, embodiments are not limited thereto. The charts may display any of the result data in any desirable manner (e.g., scatter plots, heat maps, etc.). The “Charts” menu item may include a sub-menu with one or more preset chart types for displaying the aggregated data of one or more experiments of the particular project.

[00785] In some implementations, the UI display 8000 may include filters for adjusting the data displayed in the generated charts. In some instances, the UI display 8000 may further provide binning of data to group the data into desired categories. In response to an amount of data exceeding a threshold for a particular chart, the UI display 8000 may provide a warning to the user that the data may not be able to be legibly charted or graphed. The UI display 8000 may prompt the user to select a desired option from a plurality of options. The options may include: plotting all of the data anyway; longitudinal charting and/or pagination of data; changing the format or type of chart; and data binning and/or population sampling to simplify the chart (e.g., collapsing multiple data points into a reduced data set/single data point (e.g., mean, median, interpolation, etc.) at the spot/well/plate/assay level rather than plotting each individual data point). In some implementations, a quality control module may first remove spurious and/or anomalous data prior to collapsing the data to obtain a more representative data set/point, such as for example, utilizing

the QC Criteria modules described herein. In other examples, a processor may remove data points that do not meet one or more quality criterion.

[00786] Once the data are charted, further data points for exclusion may become apparent. In some implementations, a user, and/or one or more processors, may mark a result for exclusion from further analysis, and/or for rerunning an assay and/or a portion of an assay at a later time. When a result for exclusion is detected, a control may be used to determine the reasons that the result may be spurious, anomalous, or otherwise require exclusion (e.g., due to an issue with a reactant, sample, well-plate, and/or device).

[00787] FIG. 88 depicts the UI display 8000 with a “Controls” menu item selected. The “Controls” menu item displays results of controls (e.g., samples with known results/responses) for a particular experiment and/or assay. Based on the control results, a reason for the excluded results found in the “Results” and/or “Charts” menu items may be determined by a user and/or one or more processors. For example, if a result for particular control for a particular experiment and/or multi-well plate does not substantially match the known data for the particular control, the user may confirm a spurious and/or anomalous result of the sample data, and determine the reason for the spurious and/or anomalous result of the sample data. In other examples, this can be performed by the processor, such as in an automated fashion in which the spurious and/or anomalous result can be identified and the reason determined without the intervention of a user. In further examples, by utilizing the control data, the user, and/or the one or more processors, may exclude the spurious and/or anomalous sample results.

[00788] FIG. 89 depicts a portion of the UI display 8000 with the “Dashboard” menu item selected. The “Dashboard” menu item displays the experiments of the project, and further includes an exclusion column 8006. The exclusion column 8006 includes a check mark next to sample data to be included for data analysis of the particular project and an empty box, or square, to exclude the corresponding sample data from the data analysis for the particular project. In some embodiments, the check mark scheme described in conjunction with the Project Module can be implemented in the same and/or similar fashion as other modules described here, for example in [para. 00645]. Just as described in those other embodiment, the check mark scheme can be color coded, such to designate whether the sample was selected by a user (e.g., manually) or by the process (e.g., automatically) or to provide a relative degree of how the sample compares to an expected result (e.g., green if the data are within a spec, range, and/or limit, yellow if the data are

slightly outside a spec, range, and/or limit, and red if the data are far out of a spec, range, and/or limit). The sample data may correspond to assays performed at a spot, well, and/or multi-well plate. Based on the data analysis, a user, and/or one or more processors, may add a new assay and/or experiment to the particular project, append new samples and/or assays, and/or experiments, and/or select certain samples, assays, and/or experiments to be rerun. In some implementations, the “Dashboard” menu item may include a button or other input to add a new assays and/or experiments to a particular project. In some implementations, a separate menu item for adding assays and/or experiments may be included.

[00789] FIG. 90 depicts the UI display 8000 with the “Add Assays” option selected. Under the “Add Assays” section, the user is given options for adding new items (experiments and/or assays, etc.) to the particular project in a manner similar to adding a new experiment noted above with reference to FIGS. 64A-64RR. For example, the user is presented with a list of Assay Methods and is selecting one or more Assay Methods to add to a Project. Each Assay Method is composed of one or more Assays. Thus, the user may add more Assays (via Assay Methods) into the Project and the result is the auto-generation of one or more experiments in that Project. Once the new assay and/or experiment are added to the particular project and performed, the results may be added to the particular project for analysis with previously completed experiments and/or assays.

[00790] Meanwhile, marked results corresponding to certain experiments and/or assays may be re-run, and the new results may be added to the particular project. FIG. 91 depicts a “Data Table” view under the “Review” menu item. Under the “Data Table” view, the marked data from an experiment and/or assay may be displayed. The “Data Table” may be configured to show any desired data. In the depicted embodiment, the Detection range, the Percent (%) Recovery, and the Percent (%) Recovery Mean are displayed as columns for a plurality of sample results. The “Data Table” further includes a “Flagged” column, a “Flagged Reason” column, an “Excluded” column, an “Excluded Reason” column, a “Re-Run” column, and a “Re-Run Reason” column.

[00791] Under the “Flagged” column, the UI display 8000 indicates whether a particular result was flagged by one or more processors (e.g., in response to the particular result not meeting a quality control criterion, such as, for example, those established through the QC Criteria Modules), in response to an input from a user, or not flagged. The “Flagged Reason” column includes an indication of why a particular result was flagged by the one or more processors. The “Excluded” column indicates whether a particular result was excluded by the processor (e.g., in response to

the particular result not meeting a quality control criterion), in response to an input from the user, or not excluded. The “Excluded Reason” indicates why the particular result was excluded. The one or more processors may generate the reason (e.g., not meeting the quality control criterion such as a calculated concentration being below .30). Alternatively, or additionally, a user may input a reason when excluding a particular result. The “Re-Run” column indicates whether a particular assay associated with a particular result is marked for re-running (e.g., repeating a particular assay) by the processor and/or in response from an input from the user. The “Re-Run Reason” indicates a reason for the Re-Run. The reason may be generated by the one or more processors and/or received from an input from the user. In this embodiment, the GUI displays a summary of which data were flagged and/or excluded, for what reasons, whether the sample should be re-run and why, etc., thereby allowing users to more quickly and efficiently review their results and make the necessary adjustments to improve and refine the resulting data.

[00792] FIG. 92 depicts the UI display 8000 displaying a prompt for the user to enter a reason for a particular re-run. Upon receiving an input from the user indicative of confirmation of the reason, the inputted reason may be displayed in the “Data Table” view of the UI display 8000 of FIG. 91. In some implementations, the one or more processors may further flag additional assays that may affect the particular flagged assay that corresponds to the spurious and/or anomalous results. In other embodiments, in addition to providing an input for users to manually report the reasons for re-runs, the processor can display a prepopulated list of reasons for users to select that appropriately characterize the need to re-run their samples.

[00793] Referring to FIG. 93, upon confirmation of the reason for re-run, the UI display 8000 will display assays that should be included in the designated rerun. For example, for a particular sample to be rerun, all assays that affect that particular sample result for a particular assay method are also re-run. That is, all assays performed using the same assay method to test the particular sample are marked for re-run. In the depicted embodiment, the UI display 8000 indicates that Sample X assay IL-6 was marked for re-run (either by the user or the processor) and Sample X, assay IL-2 is also now marked for re-run because IL-2 and IL-6 are on the same assay method Z. Thus, Sample X, IL-2 may affect Sample X, IL-6. In some implementations, all assays performed in spots 1-10 of a particular well are marked for re-run when at least one of those samples are marked for re-run. In other examples, only a subset of the assays that should be included in a designated rerun are displayed. In those examples, subsets of samples to be re-run can be separated

by sample, experiment, and/or assay type, time, failure mode (e.g., reason why the sample is being rerun), etc.

[00794] Referring to FIG. 94, if the user attempts to re-run one or more samples, the UI display 8000 may display a warning. In the depicted embodiment, the warning prompts the user to either remove all samples/assay from being marked for re-run, or cancel the removal of the assays from the re-run. Once the desired samples/assays are marked for re-run, the UI display 8000 may display all samples/assays marked for rerun. In other examples, the displayed warning may explain to the users that other, related samples will require re-running as well, if a particular sample is re-run. In still further embodiments, the warning can indicate that a particular sample is unable to be re-run again. In this example, the GUI can display an option to the user to remove the sample from the set without re-running it or leaving the data with the outlier in the data set.

[00795] Referring to FIG. 95, the UI display 8000 displays the “Dashboard” view for a project. Each experiment associated with the project is displayed. An indication of sample results that are excluded from results and/or marked for re-run is displayed on the UI display 8000. In the depicted embodiment, a first indication 8008 is activated and indicates a number of samples/assays marked for re-run on a particular multi-well plate is depicted with a flag and the total number of samples/assays to be rerun (e.g., 6). Meanwhile, a second indication 8010 is activated and indicates the number of samples/assays excluded from a particular data set corresponding to a sample/assay of a particular multi-well plate. The second indication 8010 is depicted as a circle with an “x” with the total number of samples/assays to be excluded from the project analysis (e.g., 20). Further, a third indication 8012 is activated and indicates the total number of samples/assays that are to be re-run for a particular project. In the depicted embodiment, the third indication 8012 comprises a reload symbol (e.g., a circularly shaped arrow) with the total number of samples/assays that are to be re-run (e.g., 23) in the particular project. Each indication 8008, 8010, and 8012 may be user selectable to open a review screen displaying samples/assays marked for re-run or marked for exclusion for a particular multi-well plate and/or an edit screen to edit the samples/assay designated among these indicators. In some implementations, in response to the user selecting the third indication 8012, the UI display 8000 may display all samples/assays that are marked for re-run across all experiments and/or multi-well plates for a particular project. Referring to FIG. 96, the UI display 8000 displays all samples/assays marked for re-run for review by the user. After reviewing the marked samples/assays, the user may initiate re-running of the

marked samples/assay and/or the processor can initiate the same (such as, for example, using the assay guide modules described above in Guided mode with a fully automated platform, as described in greater detail herein).

[00796] Referring to FIG. 97, in response to receiving an input from the user, the UI display 8000 displays a re-run view displaying the samples and assays to be re-run. The processes described above can be iterative, in the sense that re-run samples can further be flagged, excluded, and/or marked for re-“re-run,” etc., and the process may repeat until the user elects to continue with the data as presently received, reported, and displayed. Moreover, the user may create or design one or more experiments on one or more multi-well plates for re-running the marked samples/assays. Additionally, the user may adjust the assay methods associated with a particular sample ID. Referring to FIG. 98, in response to receiving an input from the user, the UI display 8000 may display a “Select Assay” view with user selectable menu items. For example, a user may change one or more assays to be performed on a particular sample marked for re-run to create a new experiment to be included in the particular project.

[00797] After the marked samples/assays are re-run, and/or the new experiments are performed, they may be added to the project for analysis with the desired previously performed experiments. Using the techniques presented herein, a user interface for quickly analyzing data, excluding spurious and/or anomalous data, designing experiments to re-run samples/assays corresponding to the spurious and/or anomalous data, and/or adding new experiments to an ongoing project is provided.

[00798] Fig. 99 is a flowchart of an example method for conducting one or more experiments. At operation 9910, the method includes displaying on a graphical user interface (GUI) aggregated data corresponding to one or more samples of one or more assays of the one or more experiments, wherein one or more assay are performed in one or more containers.

[00799] At operation 9920, the method includes displaying on the GUI an indicator for indicating which of the one or more samples are to be repeated.

[00800] At operation 9930, the method includes providing a command, by one or more processors, to repeat the one or more indicated samples.

[00801] Further embodiments include:

[00802] Embodiment 1 includes a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method

comprising: providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide for the establishment of at least one criterion to be applied against one or more experiments.

[00803] Embodiment 2 includes the method of embodiment 1, wherein the one or more criterion provide for establishing, recalling, refining, modifying, and/or editing one or more criteria as applied to data related to the one or more experiments.

[00804] Embodiment 3 includes the method of embodiments 1 or 2, wherein the one or more experiments include an assay-based experiment.

[00805] Embodiment 4 is the method of any of embodiments 1 to 3, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

[00806] Embodiment 5 is the method of any of embodiments 1 to 4, wherein the one or more criterion provide for filtering, limiting, truncating, and/or customizing one or more data sets related to the one or more experiments.

[00807] Embodiment 6 is the method of embodiment 5, wherein the one or more data sets can be limited and/or filtered by upper and/or lower data limits of data related to the one or more experiments.

[00808] Embodiment 7 is the method of embodiment 5 or 6, wherein the one or more data sets can be limited and/or filtered by one or more customizable ranges of data related to the one or more experiments.

[00809] Embodiment 8 is the method of any of embodiments 1 to 7, wherein the first menu of one or more user-selectable menu items includes the options of designing one or more criterion, creating one or more new criterion, and/or recalling one or more previously created criterion.

[00810] Embodiment 9 is the method of embodiments 8, wherein in response to a selection of the creating one or more new criterion, the first portion is adapted to display options to limit, exclude, and/or flag certain data from the data related to the one or more experiments.

[00811] Embodiment 10 is the method of any of embodiments 8 to 9, wherein the one or more new criterion comprises ECL-related parameters, including one or more of signal, adjusted signal, Signal %CV, calc. concentration, calc. concentration %CV, and/or % Recovery.

[00812] Embodiment 11 is the method of any of embodiments 9 to 10, wherein the options to limit, exclude, and/or flag certain data includes filtering the data by one or more of a less-than value, an equal-to value, a greater-than value, within a range of values, and/or within one or more reference values.

[00813] Embodiment 12 is the method of any of embodiments 8 to 11, wherein the first portion is adapted to display a confirmation screen for storing the one or more newly created criterion.

[00814] Embodiment 13 is the method of embodiment 12, wherein the one or more newly created criterion can be later recalled, edited, and/or modified.

[00815] Embodiment 14 is the method of any of embodiments 8 to 13, wherein in response to a selection of recalling one or more previously created criterion, the first portion is adapted to display criterion from a previously created and saved set of criteria.

[00816] Embodiment 15 is the method of embodiment 14, wherein the set of criteria includes one or more criterion related to the experiment.

[00817] Embodiment 16 is the method of any of embodiments 1 to 15, wherein the first menu of one or more user-selectable menu items includes the options of displaying one or more of recent and/or available criteria.

[00818] Embodiment 17 is the method of embodiment 16, wherein in response to a selection of the available criteria, the first portion is adapted to display one or more of the individual who created the criteria, the date the criteria was created, and/or name of the criteria.

[00819] Embodiment 18 is the method of any of embodiments 1 to 17, wherein the UI display further includes an advanced selector, wherein in response to a first selection of the advanced selector, the UI display is adapted to display an advanced context menu that includes advanced menu choices.

[00820] Embodiment 19 is the method of embodiment 18, wherein the advanced menu choices include an option to display one or more of sets of criteria.

[00821] Embodiment 20 is the method of embodiment 19, wherein the display of one or more sets of criteria include: displaying existing criteria, displaying only visible criteria, displaying all criteria, and/or displaying only hidden criteria.

[00822] Embodiment 21 is the method of any of embodiments 18 to 19, wherein the advanced menu choices includes an option to hide criteria which, when selected, excludes hidden criteria from being displayed by the UI display.

[00823] Embodiment 22 is the method of embodiment 21, wherein the advanced menu choices includes an option to show visible criteria which, when selected, displays on the UI display all criteria except for the hidden criteria.

[00824] Embodiment 23 is the method of any of embodiments 18 to 22, wherein the advanced menu choices includes an option to show all criteria, which, when selected, allows all criteria to be displayed by the UI display.

[00825] Embodiment 24 is a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising: providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to create, organize, and/or aggregate data related to one or more experiments.

[00826] Embodiment 25 is the method of embodiment 24, wherein the organization and/or aggregation of data provides for editing, reviewing, processing, and/or combining of the data related to the one or more experiments.

[00827] Embodiment 26 is the method of embodiments 24 or 25, wherein the one or more experiments include an assay-based experiment.

[00828] Embodiment 27 is the method of embodiment 26, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

[00829] Embodiment 28 is the method of any of embodiments 24-27, wherein the organization and/or aggregation of data includes displaying one or more data summaries, including one or more of charts, graphs, and/or data in tabular form.

[00830] Embodiment 29 is the method of any of embodiments 25-28, wherein the data related to the one or more experiments includes data from two or more dissimilar experiments.

[00831] Embodiment 30 is the method of any of embodiments 25-29, wherein the data related to the one or more experiments includes data from two or more similar experiments.

[00832] Embodiment 31 is a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising: providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to review and/or analyze data related to one or more experiments.

[00833] Embodiment 32 is the method of embodiment 31, wherein reviewing and/or analyzing the data includes highlighting and/or focusing particular data of interest related to the one or more experiments.

[00834] Embodiment 33 is the method of embodiment 31 or 32, wherein the one or more experiments include an assay-based experiment.

[00835] Embodiment 34 is the method of any of embodiments 31 to 33, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

[00836] Embodiment 35 is the method of any of embodiments 31 to 34, wherein the highlighting and/or focusing particular data of interest is performed on one or more attributes of the data, including patient age, gender, and/or disease type.

[00837] Embodiment 36 is the method of any of embodiments 32 to 35, wherein only the highlighted and/or focused data is displayed by the UI display.

[00838] Embodiment 37 is the method of any of embodiments 32 to 36, wherein the highlighted and/or focused data is adapted to be selected by a user.

[00839] Embodiment 38 is a method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising: providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to manipulate data related to one or more experiments.

[00840] Embodiment 39 is the method of embodiment 38, wherein the data manipulation includes establishing, recalling, refining, modifying, and/or editing one or more criteria as applied to data related to the one or more experiments.

[00841] Embodiment 40 is the method of any of embodiments 38 or 39, wherein the data manipulation includes editing, reviewing, processing, and/or combining of the data related to the one or more experiments

[00842] Embodiment 41 is the method of any of embodiments 38 to 40, wherein the data manipulation includes highlighting and/or focusing particular data of interest related to the one or more experiments.

[00843] Embodiment 42 is the method of any of embodiments 38 to 41, wherein the one or more experiments include an assay-based experiment.

[00844] Embodiment 43 is the method of embodiment 42, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

[00845] Embodiment 44 is the method of any of embodiments 38 to 43, wherein the data obtained from an ECL-based immunoassay.

[00846] Embodiment 45 is method executed by one or more processors for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method

comprising: providing, by one or more processors, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and providing, by the one or more processors, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises data related to one or more experiments and at least one corresponding indicator.

[00847] Embodiment 46 is the method of embodiment 45, wherein the indicator indicates whether results of one or more samples from among the one or more experiments meet a quality criterion.

[00848] Embodiment 47 is the method of embodiment 46, wherein the quality criterion comprises a threshold value for a particular sample based on a control.

[00849] Embodiment 48 is the e method of embodiment 46, wherein, in response to the results of a particular sample failing to meet the quality criterion, the one or more processors indicate the particular sample to be re-run.

[00850] Embodiment 49 is the method of embodiment 46 wherein the quality criterion comprises ECL-related parameters, including one or more of signal, adjusted signal, Signal %CV, calc. concentration, calc. concentration %CV, and/or % Recovery.

[00851] Embodiment 50 is the method of embodiment 49, wherein the one or more processors are further configured to activate indicators corresponding to one or more samples that affect a particular assay corresponding to the particular sample.

[00852] Embodiment 51 is the method of embodiment 50, wherein the one or more samples that affect the particular assay met the quality criterion.

[00853] Embodiment 52 is the method of embodiment 50, wherein the one or more processors are further configured to deactivate indicators in response to receiving an input from a user.

[00854] Embodiment 53 is the method of embodiment 48, wherein the one or more processors are further configured to display instructions to guide the user through a rerun process.

[00855] Embodiment 54 is the method of embodiment 45, wherein the indicator indicates whether one or more samples of the one or more experiments should be re-run.

[00856] Embodiment 55 is the method of embodiment 45, wherein the indicator indicates whether a particular spot, well, and/or plate of the one or more experiments should be re-run.

[00857] Embodiment 56 is the method of embodiment 55, wherein one or more samples from among the one or more experiments are derived from a single well, a plurality of wells, single plate, and/or a plurality plates.

[00858] Embodiment 57 is the method of embodiment 45, wherein the indicator is activated in response to receiving an input from a user.

[00859] Embodiment 58 is the method of embodiment 45, further comprising: aggregating results of one or more samples from among one or more experiments, each with one or more active indicators; displaying the aggregated results with an indication of why the one or more active indicators were activated; providing, by the one or more processors, a third command for a third menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein menu items from among the third menu comprises one or more assays indicated to be re-run.

[00860] Embodiment 59 is the method of embodiment 45, further comprising defining a quality control criterion via a quality control module; and analyzing the data based on the quality control criterion.

[00861] Embodiment 60 is the method of embodiment 45, further comprising displaying one or more charts representative of the data related to one or more experiments, wherein data displayed in the one or more charts is user selectable.

[00862] Embodiment 61 is the method of embodiment 60, wherein the at least one corresponding indicator is activated in response to corresponding data being selected in the one or more charts.

[00863] Embodiment 62 is the method of embodiment 61, wherein the one or more processors are further configured to activate indicators based on a quality control criterion; and the one or more of the activated indicators are deactivated in response to an input from the user.

[00864] Embodiment 63 is the method of embodiment 45, wherein the one or more user-selectable menu items of the second menu comprises a project including the one or more experiments.

[00865] Embodiment 64 is the method of embodiment 63, wherein the project comprises n experiments that can be expanded to z experiments, wherein $z > n$.

[00866] Embodiment 65 is the method of embodiment 64, wherein the project can be expanded up to z experiments through n+m experiments, wherein m is one or more new experiments added to the project at a later time, and/or re-runs of a previously run experiment from an original set of n experiments.

[00867] Embodiment 66 is the method of embodiment 65, wherein the project extends over time and n experiments are performed up through a first instance in time and m experiments are performed after the first instance in time.

[00868] Embodiment 67 is a method, executed by one or more processors, for conducting one or more experiments, the method comprising: displaying on a graphical user interface (GUI) aggregated data corresponding to one or more samples of one or more assays of the one or more experiments, wherein one or more assay are performed in one or more containers; displaying on the GUI an indicator for indicating which of the one or more samples are to be repeated; and providing a command, by one or more processors, to repeat the one or more indicated samples.

[00869] Embodiment 68 is the method of embodiment 67, wherein the indicator is displayed based on the aggregated data corresponding to the one or more samples not meeting a quality criterion, wherein the quality criterion comprises a threshold value for a particular sample.

[00870] Embodiment 69 is the method of embodiment 68, wherein the threshold value for a particular sample is based on a control.

[00871] Embodiment 70 is the method of embodiment 69, wherein, in response to results of a particular sample failing to meet the quality criterion, the one or more processors indicates the particular sample to be repeated.

[00872] Embodiment 71 is the method of embodiment 70, wherein the quality criterion comprises ECL-related parameters, including one or more of signal, adjusted signal, Signal %CV, calc. concentration, calc. concentration %CV, and/or % Recovery.

[00873] Embodiment 72 is the method of embodiment 71, wherein the one or more processors are further configured to activate indicators corresponding to one or more samples that affect a particular assay corresponding to the particular sample.

[00874] Embodiment 73 is the method of embodiment 72, wherein the one or more samples that affect the particular assay met the quality criterion.

[00875] Embodiment 74 is the method of embodiment 72, wherein the one or more processors are further configured to deactivate indicators in response to an input from a user.

[00876] Embodiment 75 is the method of embodiment 70, wherein the one or more processors are further configured to display instructions to guide the user through a rerun process.

[00877] Embodiment 76 is the method of embodiment 67, wherein the indicator further indicates whether one or more samples should be excluded from the aggregated data.

[00878] Embodiment 77 is the method of embodiment 67, wherein the indicator indicates whether a particular sample performed in a particular container of the one or more containers should be repeated.

[00879] Embodiment 78 is the method of embodiment 77, wherein the particular container comprises spot, well, and/or plate.

[00880] Embodiment 79 is the method of embodiment 78, wherein one or more samples are derived from a single well, a plurality of wells, single plate, and/or a plurality plates.

[00881] Embodiment 80 is the method of embodiment 67, wherein the indicator is activated in response to receiving an input from a user.

[00882] Embodiment 81 is the method of embodiment 67, further comprising: aggregating results of the one or more samples, each with one or more active indicators; displaying the aggregated results with an indication of why the one or more active indicators were activated; and providing, by the one or more processors, a command for a menu of one or more user-selectable menu items to be displayed on a first portion of the GUI in response to receiving a user's selection.

[00883] Embodiment 82 is the method of embodiment 67, further comprising defining a quality control criterion via a quality control module; and analyzing the data based on the quality control criterion.

[00884] Embodiment 83 is the method of embodiment 67, further comprising displaying one or more charts representative of the aggregated data related to one or more experiments, wherein data displayed in the one or more charts is user selectable.

[00885] Embodiment 84 is the method of embodiment 83, wherein the indicator is activated in response to corresponding data being selected in the one or more charts.

[00886] Embodiment 85 is the method of embodiment 84, wherein the one or more processors are further configured to activate indicators based on a quality control criterion; and the one or more of the activated indicators are deactivated in response to an input from the user.

[00887] Embodiment 86 is the method of embodiment 67, wherein the aggregated data represents a project including the one or more experiments.

[00888] Embodiment 87 is the method of embodiment 86, wherein the project comprises n experiments that can be expanded to z experiments, wherein $z > n$.

[00889] Embodiment 88 is the method of embodiment 87, wherein the project can be expanded up to z experiments through $n+m$ experiments, wherein m is one or more new experiments added to the project at a later time, and/or repeats of a previously run experiment from an original set of n experiments.

[00890] Embodiment 89 is the method of embodiment 88, wherein the project extends over time and n experiments are performed up through a first instance in time and m experiments are performed after the first instance in time.

[00891] The terminology used herein is for the purpose of describing particular embodiments only and is not intended to be limiting of the invention. As used herein, the singular forms "a", "an" and "the" are intended to include the plural forms as well, unless the context clearly indicates otherwise. It will be further understood that the terms "includes" and/or "including," when used in this specification, specify the presence of stated features, integers, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, and/or groups thereof.

[00892] The embodiments described above are illustrative examples and it should not be construed that the present invention is limited to these particular embodiments. It should be understood that various embodiments disclosed herein may be combined in different combinations than the combinations specifically presented in the description and accompanying drawings. It should also be understood that, depending on the example, certain acts or events of any of the processes or methods described herein may be performed in a different sequence, may be added, merged, or left out altogether (e.g., all described acts or events may not be necessary to carry out the methods or processes). In addition, while certain features of embodiments hereof are described as being performed by a single module or unit for purposes of clarity, it should be understood that the features and functions described herein may be performed by any combination of units or modules. Thus, various changes and modifications may be affected by one skilled in the art without departing from the spirit or scope of the invention as defined in the appended claims.

CLAIMS:

What is claimed is:

1. A method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising:
providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and
providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection,
wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and
further wherein the one or more user-selectable menu items of the second menu comprises menu items provide for establishment of at least one criterion to be applied against one or more experiments.
2. The method of claim 1, wherein the one or more criterion provide for establishing, recalling, refining, modifying, and/or editing one or more criteria as applied to data related to the one or more experiments.
3. The method of claim 1 or 2, wherein the one or more experiments include an assay-based experiment.
4. The method of claim 3, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.
5. The method of any one of claims 1 to 4, wherein the one or more criterion provide for filtering, limiting, truncating, and/or customizing one or more data sets related to the one or more experiments.

6. The method of claim 5, wherein the one or more data sets can be limited and/or filtered by upper and/or lower data limits of data related to the one or more experiments.

7. The method of claim 5 or 6, wherein the one or more data sets can be limited and/or filtered by one or more customizable ranges of data related to the one or more experiments.

8. The method of any one of claims 1 to 7, wherein options of the first menu of one or more user-selectable menu items include designing one or more criterion, creating one or more new criterion, and/or recalling one or more previously created criterion.

9. The method of claim 8, wherein in response to a selection of the creating one or more new criterion, the first portion is adapted to display options to limit, exclude, and/or flag certain data from the data related to the one or more experiments.

10. The method of any one of claims 8 to 9, wherein the one or more new criterion comprises ECL-related parameters, including one or more of signal, adjusted signal, Signal %CV, calc. concentration, calc. concentration %CV, and/or % Recovery.

11. The method of any one of claims 9 to 10, wherein the options to limit, exclude, and/or flag certain data includes filtering the data by one or more of a less-than value, an equal-to value, a greater-than value, within a range of values, and/or within one or more reference values.

12. The method of any one of claims 8 to 11, wherein the first portion is adapted to display a confirmation screen for storing the one or more new criterion.

13. The method of claim 12, wherein the one or more newly created criterion can be later recalled, edited, and/or modified.

14. The method of any one of claims 8 to 13, wherein in response to a selection of recalling one or more previously created criterion, the first portion is adapted to display criterion from a previously created and saved set of criteria.

15. The method of claim 14, wherein the set of criteria includes one or more criterion related to the experiment.

16. The method of any one of claims 1 to 15, wherein options of the first menu of one or more user-selectable menu items includes displaying one or more of recent and/or available criteria.

17. The method of claim 16, wherein in response to a selection of the available criteria, the first portion is adapted to display one or more of an individual who created the criteria, a date the criteria was created, and/or name of the criteria.

18. The method of any one of claims 1 to 17, wherein the UI display further includes an advanced selector, wherein in response to a first selection of the advanced selector, the UI display is adapted to display an advanced context menu that includes advanced menu choices.

19. The method of claim 18, wherein the advanced menu choices include an option to display one or more of sets of criteria.

20. The method of claim 19, wherein the display of one or more sets of criteria include: displaying existing criteria, displaying only visible criteria, displaying all criteria, and/or displaying only hidden criteria.

21. The method of any one of claims 18 to 19, wherein the advanced menu choices includes an option to hide criteria which, when selected, excludes hidden criteria from being displayed by the UI display.

22. The method of claim 21, wherein the advanced menu choices includes an option to show visible criteria which, when selected, displays on the UI display all criteria except for the hidden criteria.

23. The method of any one of claims 18 to 22, wherein the advanced menu choices includes an option to show all criteria, which, when selected, allows all criteria to be displayed by the UI display.

24. A method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising:

providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and

providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection,

wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and

further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to create, organize, and/or aggregate data related to one or more experiments.

25. The method of claim 24, wherein the organization and/or aggregation of data provides for editing, reviewing, processing, and/or combining of the data related to the one or more experiments.

26. The method of claim 24 or 25, wherein the one or more experiments include an assay-based experiment.

27. The method of claim 26, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

28. The method of any one of claims 24 to 27, wherein the organization and/or aggregation of data includes displaying one or more data summaries, including one or more of charts, graphs, and/or data in tabular form.

29. The method of any one of claims 25 to 28, wherein the data related to the one or more experiments includes data from two or more dissimilar experiments.

30. The method of any one of claims 25 to 29, wherein the data related to the one or more experiments includes data from two or more similar experiments.

31. A method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising:

providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and

providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection,

wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to review and/or analyze data related to one or more experiments.

32. The method of claim 31, wherein reviewing and/or analyzing the data includes highlighting and/or focusing particular data of interest related to the one or more experiments.

33. The method of claim 31 or 32, wherein the one or more experiments include an assay-based experiment.

34. The method of any one of claims 31 to 33, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

35. The method of any one of claims 31 to 34, wherein the highlighting and/or focusing particular data of interest is performed on one or more attributes of the data, including patient age, gender, and/or disease type.

36. The method of any one of claims 32 to 35, wherein only the highlighted and/or focused data is displayed by the UI display.

37. The method of any of claims 32 to 36, wherein the highlighted and/or focused data is adapted to be selected by a user.

38. A method executed by at least one processor for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising:

providing, by at least one processor, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and

providing, by the at least one processor, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection,

wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and

further wherein the one or more user-selectable menu items of the second menu comprises menu items provide at least one option to manipulate data related to one or more experiments.

39. The method of claim 38, wherein the data manipulation includes establishing, recalling, refining, modifying, and/or editing one or more criteria as applied to data related to the one or more experiments.

40. The method of claim 38 or 39, wherein the data manipulation includes editing, reviewing, processing, and/or combining of the data related to the one or more experiments.

41. The method of any one of claims 38 to 40, wherein the data manipulation includes highlighting and/or focusing particular data of interest related to the one or more experiments.

42. The method of any one of claims 38 to 41, wherein the one or more experiments include an assay-based experiment.

43. The method of claim 42, wherein the assay-based experiment is an electrochemiluminescence (ECL)-based assay.

44. The method of any one of claims 38 to 43, wherein the data obtained from an ECL-based immunoassay.

45. A method executed by one or more processors for navigating a path of hierarchical menu levels adapted for output to a graphical user interface (GUI), the method comprising:

providing, by one or more processors, a first command for a first menu of one or more user-selectable menu items to be displayed on a first portion of a user interface (UI) display; and

providing, by the one or more processors, a second command for a second menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection,

wherein at least one of user-selectable menu items of the first menu is adapted to be displayed on a second portion of the UI display and comprises one or more of a past-selected menu item and a past-unselected menu item of the hierarchical menu levels and is adapted to be concurrently viewed with the second menu in first portion; and

further wherein the one or more user-selectable menu items of the second menu comprises data related to one or more experiments and at least one corresponding indicator.

46. The method of claim 45, wherein the indicator indicates whether results of one or more samples from among the one or more experiments meet a quality criterion.

47. The method of claim 46, wherein the quality criterion comprises a threshold value for a particular sample based on a control.

48. The method of claim 46, wherein, in response to the results of a particular sample failing to meet the quality criterion, the one or more processors indicate the particular sample to be re-run.

49. The method of claim 46 wherein the quality criterion comprises ECL-related parameters, including one or more of signal, adjusted signal, Signal %CV, calc. concentration, calc. concentration %CV, and/or % Recovery.

50. The method of claim 49, wherein the one or more processors are further configured to activate indicators corresponding to one or more samples that affect a particular assay corresponding to the particular sample.

51. The method of claim 50, wherein the one or more samples that affect the particular assay met the quality criterion.

52. The method of claim 50, wherein the one or more processors are further configured to deactivate indicators in response to receiving an input from a user.

53. The method of claim 48, wherein the one or more processors are further configured to display instructions to guide the user through a rerun process.

54. The method of claim 45, wherein the indicator indicates whether one or more samples of the one or more experiments should be re-run.

55. The method of claim 45, wherein the indicator indicates whether a particular spot, well, and/or plate of the one or more experiments should be re-run.

56. The method of claim 55, wherein one or more samples from among the one or more experiments are derived from a single well, a plurality of wells, single plate, and/or a plurality plates.

57. The method of claim 45, wherein the indicator is activated in response to receiving an input from a user.

58. The method of claim 45, further comprising:
aggregating results of one or more samples from among one or more experiments, each with one or more active indicators;
displaying the aggregated results with an indication of why the one or more active indicators were activated;
providing, by the one or more processors, a third command for a third menu of one or more user-selectable menu items to be displayed on the first portion of the UI display in response to a user's selection, wherein menu items from among the third menu comprises one or more assays indicated to be re-run.

59. The method of claim 45, further comprising defining a quality control criterion via a quality control module; and
analyzing the data based on the quality control criterion.

60. The method of claim 45, further comprising displaying one or more charts representative of the data related to one or more experiments, wherein data displayed in the one or more charts is user selectable.

61. The method of claim 60, wherein the at least one corresponding indicator is activated in response to corresponding data being selected in the one or more charts.

62. The method of claim 61, wherein the one or more processors are further configured to activate indicators based on a quality control criterion; and the one or more of the activated indicators are deactivated in response to an input from the user.

63. The method of claim 45, wherein the one or more user-selectable menu items of the second menu comprises a project including the one or more experiments.

64. The method of claim 63, wherein the project comprises n experiments that can be expanded to z experiments, wherein $z > n$.

65. The method of claim 64, wherein the project can be expanded up to z experiments through $n+m$ experiments, wherein m is one or more new experiments added to the project at a later time, and/or re-runs of a previously run experiment from an original set of n experiments.

66. The method of claim 65, wherein the project extends over time and n experiments are performed up through a first instance in time and m experiments are performed after the first instance in time.

67. A method, executed by one or more processors, for conducting one or more experiments, the method comprising:

- displaying on a graphical user interface (GUI) aggregated data corresponding to one or more samples of one or more assays of the one or more experiments, wherein one or more assay are performed in one or more containers;

- displaying on the GUI an indicator for indicating which of the one or more samples are to be repeated; and

- providing a command, by one or more processors, to repeat the one or more indicated samples.

68. The method of claim 67, wherein the indicator is displayed based on the aggregated data corresponding to the one or more samples not meeting a quality criterion, wherein the quality criterion comprises a threshold value for a particular sample.

69. The method of claim 68, wherein the threshold value for a particular sample is based on a control.

70. The method of claim 69, wherein, in response to results of a particular sample failing to meet the quality criterion, the one or more processors indicates the particular sample to be repeated.

71. The method of claim 70, wherein the quality criterion comprises ECL-related parameters, including one or more of signal, adjusted signal, Signal %CV, calc. concentration, calc. concentration %CV, and/or % Recovery.

72. The method of claim 71, wherein the one or more processors are further configured to activate indicators corresponding to one or more samples that affect a particular assay corresponding to the particular sample.

73. The method of claim 72, wherein the one or more samples that affect the particular assay met the quality criterion.

74. The method of claim 72, wherein the one or more processors are further configured to deactivate indicators in response to an input from a user.

75. The method of claim 70, wherein the one or more processors are further configured to display instructions to guide the user through a rerun process.

76. The method of claim 67, wherein the indicator further indicates whether one or more samples should be excluded from the aggregated data.

77. The method of claim 67, wherein the indicator indicates whether a particular sample performed in a particular container of the one or more containers should be repeated.

78. The method of claim 77, wherein the particular container comprises spot, well, and/or plate.

79. The method of claim 78, wherein one or more samples are derived from a single well, a plurality of wells, single plate, and/or a plurality plates.

80. The method of claim 67, wherein the indicator is activated in response to receiving an input from a user.

81. The method of claim 67, further comprising:
aggregating results of the one or more samples, each with one or more active indicators;
displaying the aggregated results with an indication of why the one or more active indicators were activated; and
providing, by the one or more processors, a command for a menu of one or more user-selectable menu items to be displayed on a first portion of the GUI in response to receiving a user's selection.

82. The method of claim 67, further comprising defining a quality control criterion via a quality control module; and
analyzing the data based on the quality control criterion.

83. The method of claim 67, further comprising displaying one or more charts representative of the aggregated data related to one or more experiments, wherein data displayed in the one or more charts is user selectable.

84. The method of claim 83, wherein the indicator is activated in response to corresponding data being selected in the one or more charts.

85. The method of claim 84, wherein the one or more processors are further configured to activate indicators based on a quality control criterion; and the one or more of the activated indicators are deactivated in response to an input from the user.

86. The method of claim 67, wherein the aggregated data represents a project including the one or more experiments.

87. The method of claim 86, wherein the project comprises n experiments that can be expanded to z experiments, wherein $z > n$.

88. The method of claim 87, wherein the project can be expanded up to z experiments through $n+m$ experiments, wherein m is one or more new experiments added to the project at a later time, and/or repeats of a previously run experiment from an original set of n experiments.

89. The method of claim 88, wherein the project extends over time and n experiments are performed up through a first instance in time and m experiments are performed after the first instance in time.
