

ABSTRACT

Disclosed is a resource transfer method based on near field communication. The method includes: acquiring a user identifier of a current login user in a first resource management client by a resource transfer terminal of a target merchant according to the triggering of the
5 first resource management client, and outputting target merchant authentication information; when it is determined that the resource transfer terminal has enabled a fixed quantity resource transfer mode, generating a resource transfer order by the resource transfer terminal according to a preset quantity of resources transferred by each order; and adding a user
signature and a merchant signature to the resource transfer order, and then storing the
10 resource transfer order with the signatures.
