

Description

This invention relates to a curable adhesive composition, and more particularly to an adhesive composition which is curable by the action of heat or light and useful as an adhesive for surface mounting devices (hereinafter referred to as "SMD").

Mounting of SMD, such as chip resistors and chip capacitors, on printed circuit boards has been carried out by temporarily fixing the SMD to the circuit board with an adhesive and then soldering repeatedly. In the soldering step, the adhesion performance of the adhesive is reduced due to abrupt thermal shocks to cause release of the SMD. It has been, therefore, demanded to develop an adhesive whose adhesion performance is not subject to change between before and after the soldering step.

SUMMARY OF THE INVENTION

One object of this invention is to provide a curable adhesive composition suitable as an adhesive for mounting SMD on printed circuit boards.

The present invention relates to a curable adhesive composition comprising a polymerizable prepolymer selected from the group consisting of an unsaturated polyester, an epoxy (meth)acrylate, a urethane (meth)acrylate and an oligoester (meth)acrylate, a reactive diluent which differs from said polymerizable prepolymer, which reactive diluent is selected from the group consisting of a mono- or polyfunctional (meth)acrylate, said reactive diluent being added to adjust the viscosity of the curable adhesive composition, and a polymerization initiator for the polymerization of ethylenically unsaturated groups, wherein said composition further comprises an inorganic filler comprising a combination of a spherical inorganic filler and a flaky inorganic filler;

characterized in that the contents of said spherical inorganic filler and flaky inorganic filler are from 10 to 50 parts by weight and from 50 to 150 parts by weight, respectively, based on 100 parts by weight of the total amount of said polymerizable prepolymer and reactive diluent.

Preferably the curable adhesive composition further comprises a (meth)acrylate having an isocyanurate ring in an amount of from 1 to 40 parts by weight based on 100 parts by weight of the total amount of said polymerizable prepolymer and reactive diluent, said (meth)acrylate having an isocyanurate ring being added to improve the adhesion strength at room temperature or high temperature of the curable adhesive composition.

The curable adhesive composition of this invention exhibits high adhesion strength at room temperature, which undergoes substantially no reduction even on repeated exposure to a soldering temperature, and hence effectively prevents release of SMD.

DETAILED DESCRIPTION OF THE INVENTION

The polymerizable prepolymer according to the invention is selected from unsaturated polyesters, epoxy (meth)acrylates, urethane (meth)acrylates and oligoester (meth)acrylates.

The above-described unsaturated polyesters are polyesters having a molecular weight of from 1,000 to 10,000 and containing therein ethylenically unsaturated bonds and are commercially available under the trade names of, for example, Upica® 8554 (made by Nippon Upica Co., Ltd.) and New Track® 410 S (made by Kao Corporation).

The above-described epoxy (meth)acrylates are products obtained by esterifying epoxy resins having bisphenol-A, phenol or cresol novolak as a skeleton with (meth)acrylic acid and are commercially available under the trade names of, for example, Ripoxy® SP-1509 and SP-4010 (made by Showa Highpolymer Co., Ltd.).

The above-described urethane (meth)acrylates are generally obtained by reacting a diol such as aliphatic diols (e.g., ethylene glycol, etc.), ether diols having two hydroxyl groups at the ether chain terminal ends, and ester diols having two hydroxyl groups at the ester chain terminal ends with a stoichiometric excess of a diisocyanate such as toluene diisocyanate, isophorone diisocyanate, etc. to form a urethane compound having isocyanate groups at the terminal ends which is then further reacted with a hydroxyalkyl (meth)acrylate. Commercial products are available under the trade names of, for example, Uvithane® 893 (made by Thiochol Chemical Corp.) and U-6HA (made by Shin Nakamura Kagaku Kogyo Co., Ltd.).

The above-described oligoester (meth)acrylates are polyfunctional (meth)acrylates having, as a skeleton, an ester compound obtained from aromatic carboxylic acids and are commercially available under the trade names of, for example, Aronix® M-8060 and M-7100 (made by Toagosei Chemical Industry Co., Ltd.).

The reactive diluent which is used in this invention is added for the purpose of adjusting the viscosity of the curable composition or characteristics of cured products, and is selected from polyfunctional (meth)acrylates and monofunctional (meth)acrylates.

Examples of the above-described polyfunctional (meth)acrylates include trimethylolpropane tri(meth)acrylate, pentaerythritol tetra(meth)acrylate, dipentaerythritol hexa(meth)acrylate, tris[meth](acryloxyethyl)isocyanurate, 1,6-hexanediol di(meth)acrylate, triethylene glycol di(meth)acrylate, neopentyl glycol di(meth)acrylate, polyethylene glycol di(meth)acrylate, neopentyl glycol hydroxypivalate di(meth)acrylate, (meth)acrylated compounds of bisphenol A having ethylene oxide added thereto, and diglycidyl ester di(meth)acrylates of dibasic fatty acids containing 4 or more carbon atoms. Commercial products are available under the trade names of, for example, Viscoat® #3700 and #700 (made by Osaka Yuki Co., Ltd.), MANDA® (made by Nippon Kayaku Co., Ltd.), Aronix® M6100, M6300 and TD1600A (made by Dainippon Ink and Chemicals, Inc.), and ULB-20GEA (Okamura Seiyu Co., Ltd.).

Examples of the above-described monofunctional (meth)acrylates include hydroxyethyl (meth)acrylate, tetrahydrofurfuryl (meth)acrylate, phenoxyethyl (meth)acrylate, dicyclopentenyl (meth)acrylate, etc.

The weight proportion of the polymerizable prepolymer to the reactive diluent can be arbitrarily varied but is usually in the range of from 10:90 to 80:20 and preferably in the range of from 20:80 to 70:30.

The polymerization initiator as referred to herein includes both a photopolymerization initiator and/or a heat polymerization initiator.

Examples of the photopolymerization initiator include benzoin ether-based compounds, benzophenone-based compounds, acetophenone-based compounds, thioxanthone-based compounds, etc. Specific examples are benzoin isopropyl ether, benzoin isobutyl ether, benzophenone, 2,2-dimethoxy-2-phenylacetophenone, 1-hydroxycyclohexyl phenyl ketone, p-isopropyl- α -hydroxyisobutylphenone, α -hydroxyisobutyl ketone, 1,1-dichloroacetophenone, 2-chlorothioxanthone, 2-methylthioxanthone, methylbenzoyl formate, etc. These compounds can be used alone or in admixture.

As the heat polymerization initiator, usual ordinary organic peroxides can be used. Specific examples include ketone peroxides such as methyl ethyl ketone peroxide, cyclohexanone peroxide, etc.; diacyl peroxides such as acetyl peroxide, benzoyl peroxide, etc.; hydroperoxides such as t-butyl hydroperoxide, cumene hydroperoxide etc.; dialkyl peroxides such as di-t-butyl peroxyde, dicumyl peroxide, etc.; alkyl peresters such as t-butyl peracetate, t-butyl perbenzoate, etc.; peroxy carbonates such as diisopropyl peroxydicarbonate, bis(4-t-butylcyclohexyl)peroxydicarbonate, etc.; and peroxyketals such as 1,1-bis(t-butylperoxy)-3,3,5-trimethylcyclohexane, 1,1-bis(t-butylperoxy)cyclohexane, etc. These compounds can be used alone or in admixture.

The amount of the initiator is usually in the range of from 0.2 to 20 parts by weight based on 100 parts by weight of the sum of the polymerizable prepolymer and the reactive diluent.

The inorganic filler used in the present invention comprises a combination of a spherical inorganic filler and a flaky inorganic filler. The spherical inorganic filler includes spherical fused silica, glass bead, alumina powder, silica balloon, and synthetic calcium silicate. Implicit in the flaky inorganic fillers are talc, calcium silicate, zeolite, kaolin, calcined clay, bentonite, sericite, and basic magnesium carbonate. Commercially available products of inorganic fillers include FB-44 (spherical fused silica produced by Denki Kagaku Kogyo K.K.), EGB-210 (glass bead produced by Toshiba-Ballotini Co., Ltd.), LMR-100 (flaky talc produced by Fuji Talc Co., Ltd.), and Iceberg® (flaky clay produced by Bergen Pigment Co., Ltd.).

In particular, a combination of spherical fused silica or glass bead as a spherical inorganic filler and talc as a flaky inorganic filler in a specific mixing ratio is effective.

The amount of the spherical inorganic filler to be used ranges from 10 to 50 parts by weight per 100 parts by weight of the total amount of the polymerizable prepolymer and the reactive diluent. The amount of the flaky inorganic filler to be used ranges from 50 to 150 parts by weight on the same basis. If the spherical inorganic filler and flaky inorganic filler are used in admixture, the total amount thereof ranges from 60 to 200 parts by weight per 100 parts by weight of the total amount of the polymerizable prepolymer and the reactive diluent, with the mixing ratio of the spherical inorganic filler to the flaky inorganic filler being arbitrarily variable within the above-recited ranges of the respective components. If the amount of either one or both of the spherical inorganic filler and flaky inorganic filler is less than the respective lower limit, the adhesion strength after soldering is considerably reduced. If it exceeds the respective upper limit, the initial adhesion strength before soldering is reduced.

The amounts of these inorganic fillers can be appropriately controlled within the above ranges so as to obtain a viscosity suitable for end use.

The (meth)acrylate having an isocyanurate ring which can be used in the present invention is represented by formula (I):

wherein A's, which may be the same or different, each represents a hydrogen atom,

wherein R represents a hydrogen atom or a methyl group.

The compounds represented by formula (I) are known per se and can be prepared by reacting a reactive derivative of isocyanuric acid and a reactive derivative of (meth)acrylic acid.

Specific examples of the compounds of formula (I) include FA-731A (a compound wherein all of A's are

produced by Hitachi Chemical Co., Ltd.), Aronix® M-215 (a compound wherein one of A's is a hydrogen atom, and others are $\text{CH}_2=\text{CHCO}-$, produced by Toa Gosei Chemical Industry Co., Ltd.), and Aronix® M-325 (a compound wherein one of A's is $\text{CH}_2=\text{CHCOO}(\text{CH}_2)_5\text{CO}-$, and others are $\text{CH}_2=\text{CHCO}-$, produced by Toa Gosei Chemical Industry Co., Ltd.).

The (meth)acrylate having an isocyanurate ring is used in an amount usually ranging from 1 to 40 parts by weight, preferably from 5 to 30 parts by weight, per 100 parts by weight of the total amount of the polymerizable prepolymer and the reactive diluent. If the amount of this component is less than 1 part, sufficient adhesion strength at room temperature or high temperatures cannot be assured so that the SMD tends to fall down from the printed circuit board during soldering. If it exceeds 40 parts, curing reaction would drastically proceed to cause large strain during curing so that the cured adhesive tends to have brittleness and low adhesion.

The curable composition of this invention can, if desired, contain additives such as chelating agents, heat polymerization inhibitors, coloring agents, thixotropic agents, and curing accelerator, unless they hinder the object of this invention.

Specific examples of the chelating agent include iminodiacetic acid, N-methyliminodiacetic acid, nitrilotriacetic acid, ethylenediamine-N,N'-diacetic acid, ethylenediamine-N,N,N',N'-tetraacetic acid, N-hydroxy-ethylethylenediamine-N,N',N'-triacetic acid, and sodium salts thereof as well as N,N,N',N'-tetrakis-(2-hydroxypropyl)ethylenediamine, etc.

Examples of the heat polymerization inhibitor include hydroquinone, p-methoxyphenol, benzoquinone, phenothiazine, cupferron, etc.

Examples of the coloring agent include azo-based, phthalocyanine-based, isoindolinone-based and anthraquinone-based coloring agents, carbon black, etc.

Examples of the thixotropic agent include bentonite, ultrafine silica, etc.

Examples of the curing accelerator which is used in combination with cumene hydroperoxide include metal salts of long-chain organic acids, such as cobalt naphthenate, cobalt octanoate, etc.; amines such as dimethylaniline, N-phenylmorpholine, etc.; quaternary ammonium salts such as triethylbenzylammonium chloride, etc.; and aminophenols such as 2,4,6-tris(dimethylaminomethyl)phenol, etc.

The curable composition of this invention is prepared in the following manner. That is, the polymerizable prepolymer, reactive diluent, and optionally (meth)acrylate containing an isocyanurate ring as well as photopolymerization initiator, heat polymerization inhibitor, chelating agent, etc. are uniformly dissolved in advance, and thereafter, the thixotropic agent, coloring agent, etc. and optionally inorganic filler are mixed and dispersed. The heat polymerization initiator is then added and uniformly mixed. The mixing is usually carried out at not higher than 60 °C using a rotary agitator or a three-roll mill.

The present invention is now illustrated in greater detail by way of the following Examples and Comparative Examples, but it should be understood that the present invention is not deemed to be limited thereto. In these examples, all the parts are by weight unless otherwise specified.

Adhesion properties of the curable adhesive compositions obtained in these examples were measured according to the following methods.

1) Initial Adhesion Strength:

The curable composition was applied in an amount of from about 0.3 to 0.5 mg onto a printed circuit board and, after a multilayer ceramic chip capacitor (3.2 mm x 1.6 mm) was mounted in the central part thereof, the assembly was irradiated with an ultraviolet light for about 20 seconds at a distance of 20 cm from a high-pressure mercury vapor lamp having a power input of 80 W/cm. Immediately thereafter, the assembly was heated for 10 minutes in an atmosphere at 120 °C. Then, the shear adhesion strength (kg) per chip was measured at room temperature.

2) Adhesion Strength at 100 °C:

The sample as prepared in 1) above was placed on an equipment by which the temperature of the printed circuit board was maintained at 100±2 °C, and the shear adhesion strength (kg) per chip at 100 °C was measured.

3) Adhesion Strength Retention after Dipping in Soldering Bath:

The sample as prepared in 1) above was dipped in a soldering bath kept at 260±2 °C for 10 seconds and cooled to room temperature. After this soldering operation was repeatedly conducted 6 times, the shear adhesion strength (kg) was measured. An adhesion strength retention after soldering (%) was obtained by dividing the shear adhesion strength after soldering by the initial adhesion strength as measured in 1) and multiplying the quotient by 100.

EXAMPLES 1 TO 3 AND COMPARATIVE EXAMPLES 1 TO 4

Unsaturated polyester (Upica® 8554 produced by Nippon Upica Co., Ltd.; molecular weight: ca. 2,500)	100 parts
Bifunctional acrylate (ULB-20 GEA produced by Okamura Seiyu Co., Ltd.)	70 parts
Tetrahydrofurfuryl methacrylate	100 parts

The above components were uniformly dissolved by thoroughly stirring. To 100 parts of the mixture were added inorganic fillers and other components as shown in Table 1 below, followed by stirring to prepare an adhesive composition.

Each of the adhesive compositions was evaluated according to the above-described methods, and the results obtained are shown in Table 1.

As is apparent from Table 1, the compositions according to the present invention prove superior to the comparative compositions.

Claims

1. A curable adhesive composition comprising a polymerizable prepolymer selected from the group consisting of an unsaturated polyester, an epoxy (meth)acrylate, a urethane (meth)acrylate and an oligoester (meth)acrylate, a reactive diluent which differs from said polymerizable prepolymer, which reactive diluent is selected from the group consisting of a mono- or polyfunctional (meth)acrylate, said reactive diluent being added to adjust the viscosity of the curable adhesive composition, and a polymerization initiator for the polymerization of ethylenically unsaturated groups, wherein said composition further comprises an inorganic filler comprising a combination of a spherical inorganic filler and a flaky inorganic filler;
characterized in that the contents of said spherical inorganic filler and flaky inorganic filler are from 10 to 50 parts by weight and from 50 to 150 parts by weight, respectively, based on 100 parts by weight of the total amount of said polymerizable prepolymer and reactive diluent.
2. A curable adhesive composition as in claim 1, wherein said spherical inorganic filler is spherical fused silica or glass bead, and said flaky inorganic filler is talc.
3. A curable adhesive composition according to claim 1, further comprising a (meth)acrylate having an isocyanurate ring in an amount of from 1 to 40 parts by weight based on 100 parts by weight of the total amount of said polymerizable prepolymer and reactive diluent, said (meth)acrylate having an isocyanurate ring being added to improve the adhesion strength at room temperature or high temperature of the curable adhesive composition.
4. A curable adhesive composition as in claim 3, wherein said (meth)acrylate containing an isocyanurate ring is a compound represented by formula (I):

wherein A's, which may be the same or different are each a hydrogen atom,

wherein R is a hydrogen atom or a methyl group.

5. A curable adhesive composition as in claim 4, wherein all of the A's are

6. A curable adhesive composition as in claim 4, wherein one of the A's is a hydrogen atom and the other two A's are $\text{CH}_2=\text{CHCO}-$.

7. A curable adhesive composition as in claim 4, wherein one of the A's is $\text{CH}_2 = \text{CHCOO}(\text{CH}_2)_5 \text{CO}$ - and the other two A's are $\text{CH}_2 = \text{CHCO}$ -.
8. A curable adhesive composition as in claim 3, wherein said (meth)acrylate having an isocyanurate ring is used in an amount of from 5 to 30 parts by weight based on 100 parts by weight of the total amount of said polymerizable prepolymer and reactive diluent.
9. A curable adhesive composition as claimed in claim 1 or claim 4, wherein said oligoester (meth)acrylate has, as a skeleton, an ester compound obtained from an aromatic carboxylic acid, and said polyfunctional (meth)acrylate is selected from the group consisting of trimethylpropane tri(meth)acrylate, pentaerythritol tetra(meth)acrylate, dipentaerythritol hexa(meth)acrylate, tris(meth)(acryloxyethyl) isocyanurate, 1,6-hexanediol di(meth)acrylate, triethylene glycol di(meth)acrylate, neopentyl glycol di(meth)acrylate, polyethylene glycol di(meth)acrylate, neopentyl glycol hydroxypivalate di(meth)acrylate, a (meth)acrylated compound of bisphenol A having ethylene oxide added thereto, or a diglycidyl ester di(meth)acrylate of a dibasic fatty acid containing 4 or more carbon atoms.
10. The curable adhesive composition of claim 3 or claim 9, wherein said polymerizable prepolymer is selected from the group consisting of an unsaturated polyester, an epoxy (meth)acrylate and a urethane (meth)acrylate.
11. A curable adhesive composition as claimed in claim 1, claim 3 or claim 11, wherein the weight proportion of the polymerizable prepolymer to the reactive diluent is in the range of from 10:90 to 80:20 and the polymerization initiator is used in an amount of from 0.2 to 20 parts by weight based on 100 parts by weight of the sum of the polymerizable prepolymer and the reactive diluent.

Patentansprüche

1. Härtbare Klebe-Zusammensetzung, umfassend ein polymerisierbares Prepolymer, das ausgewählt ist aus der Gruppe, bestehend aus einem ungesättigten Polyester, einem Epoxy(meth)acrylat, einem Urethan(meth)acrylat und einem Oligoester(meth)acrylat; ein reaktives Verdünnungsmittel, das sich vom obigen polymerisierbaren Prepolymer unterscheidet und ausgewählt ist aus der Gruppe, bestehend aus einem mono- oder polyfunktionellen (Meth)acrylat, wobei dieses reaktive Verdünnungsmittel zugegeben wird, um die Viskosität der härtbaren Klebe-Zusammensetzung einzustellen; und einen polymerisations-initiator für die Polymerisation von ethylenisch ungesättigten Gruppen; wobei die besagte Zusammensetzung weiterhin einen anorganischen Füllstoff aus einer Kombination eines sphärischen anorganischen Füllstoffs und eines blättrigen (flaky) anorganischen Füllstoffs umfasst, dadurch **gekennzeichnet**, dass der Gehalt an sphärischem anorganischen Füllstoff bzw. blättrigem anorganischen Füllstoff 10 bis 50 Gew.-Teile bzw. 50 bis 150 Gew.-Teile, bezogen auf 100 Gew.-Teile der Gesamtmenge des polymerisierbaren Prepolymers und reaktiven Verdünnungsmittels, beträgt.
2. Härtbare Klebe-Zusammensetzung gemäss Anspruch 1, worin der sphärische anorganische Füllstoff sphärisches Silicagut (fused silica) oder Glasperlen ist und der blättrige anorganische Füllstoff Talk ist.
3. Härtbare Klebe-Zusammensetzung gemäss Anspruch 1, welche weiterhin ein (Meth)acrylat mit einem Isocyanuratrings in einer Menge von 1 bis 40 Gew.-Teile, bezogen auf 100 Gew.-Teile der Gesamtmenge des polymerisierbaren Prepolymers und des reaktiven Verdünnungsmittels, umfasst, wobei dieses (Meth)acrylat mit einem Isocyanuratrings zugegeben wird, um die Klebefestigkeit der härtbaren Klebe-Zusammensetzung bei Raumtemperatur oder hoher Temperatur zu verbessern.
4. Härtbare Klebe-Zusammensetzung gemäss Anspruch 3, dadurch **gekennzeichnet**, dass das (Meth)acrylat, das einen Cyanuratrings enthält, eine Verbindung ist, die durch die Formel (I) dargestellt wird:

(I)

worin die Buchstaben A, die gleich oder verschieden sein können, jeweils ein Wasserstoffatom,

darstellen, wobei R ein Wasserstoffatom oder eine Methylgruppe ist.

5. Härtbare Klebe-Zusammensetzung gemäss Anspruch 4, bei der alle A

bedeuten.

6. Härtbare Klebe-Zusammensetzung gemäss Anspruch 4, worin ein A ein Wasserstoffatom und die anderen beiden A $\text{CH}_2 = \text{CHCO}-$ darstellen.

7. Härtbare Klebe-Zusammensetzung gemäss Anspruch 4, worin ein A $\text{CH}_2 = \text{CHCOO}(\text{CH}_2)_5\text{CO}-$ und die anderen beiden A $\text{CH}_2 = \text{CHCO}-$ darstellen.

8. Härtbare Klebe-Zusammensetzung gemäss Anspruch 3, wobei dieses (Meth)acrylat mit einem Isocyanurating in einer Menge von 5 bis 30 Gew.-Teilen, bezogen auf 100 Gew.-Teile der Gesamtmenge des polymerisierbaren Prepolymers und reaktiven Verdünnungsmittels, verwendet wird.

9. Härtbare Klebe-Zusammensetzung gemäss Anspruch 1 oder Anspruch 4, dadurch gekennzeichnet, dass das Oligoester(meth)acrylat als Skelett-Teil eine Ester-Verbindung aufweist, die aus einer aromatischen Carbonsäure erhalten wird, und das polyfunktionelle (Meth)acrylat ausgewählt wird aus der Gruppe, bestehend aus Trimethylpropantri(meth)acrylat, Pentaerythritoltetra(meth)acrylat, Dipentaerythritolhexa(meth)acrylat, Tris(meth)(acryloxyethyl)isocyanurat, 1,6-Hexandioldi(meth)acrylat, Triethylenglykoldi(meth)acrylat, Neopentylglykoldi(meth)acrylat, Polyethylenglykoldi(meth)acrylat, Neopentylglykolhydroxypivalatdi(meth)acrylat, einer (meth)acrylierten Verbindung aus Bisphenol A, an das Ethylenoxid addiert wurde, oder einem Diglycidylesterdi(meth)acrylat einer zweibasigen Fettsäure mit 4 oder mehr Kohlenstoffatomen.

10. Härtbare Klebe-Zusammensetzung gemäss Anspruch 3 oder Anspruch 9, worin das polymerisierbare Prepolymer aus der Gruppe, bestehend aus einem ungesättigten Polyester, einem Epoxy(meth)acrylat und einem Urethan(meth)acrylat, ausgewählt ist.

11. Härtbare Klebe-Zusammensetzung gemäss Anspruch 1, Anspruch 3 oder Anspruch 11, worin das Gewichtsverhältnis des polymerisierbaren Prepolymers zum reaktiven Verdünnungsmittel im Bereich von 10:90 bis 80:20 liegt und der Polymerisationsinitiator in einer Menge von 0,2 bis 20 Gew.-Teilen,

bezogen auf 100 Gew.-Teile der Summe des polymerisierbaren Prepolymers und des reaktiven Verdünnungsmittels, verwendet wird.

Revendications

1. Composition adhésive durcissable comprenant un prépolymère polymérisable choisi dans le groupe constitué d'un polyester insaturé, d'un (méth)acrylate d'époxy, d'un (méth)acrylate d'uréthane et d'un (méth)acrylate d'oligoester, un diluant réactif qui est différent dudit prépolymère polymérisable, lequel diluant réactif est choisi dans le groupe constitué d'un (méth)acrylate mono- ou polyfonctionnel, ledit diluant réactif étant ajouté afin d'ajuster la viscosité de la composition adhésive durcissable, et un agent d'amorçage de la polymérisation pour la polymérisation de groupes éthyléniquement insaturés, où ladite composition comprend en outre une charge minérale constituée de la combinaison d'une charge minérale sphérique et d'une charge minérale en flocons;

caractérisée en ce que les teneurs desdites charges minérale sphérique et minérale en flocons sont comprises entre 10 et 50 parties et entre 50 et 150 parties en poids, respectivement, par rapport à 100 parties en poids de la quantité totale desdits prépolymère polymérisable et diluant réactif.

2. Composition adhésive durcissable selon la revendication 1, dans laquelle ladite charge minérale sphérique est de la silice sphérique obtenue par pyrogénéation ou des perles de verre, et ladite charge minérale en flocons est le talc.

3. Composition adhésive durcissable selon la revendication 1, comprenant en outre un (méth)acrylate ayant un cycle isocyanurate dans une quantité de 1 à 40 parties en poids par rapport à 100 parties en poids de la quantité totale desdits prépolymère polymérisable et diluant réactif, ledit (méth)acrylate ayant un cycle isocyanurate qui est ajouté pour améliorer la résistance de l'adhérence à la température ambiante ou à une température élevée de la composition adhésive durcissable.

4. Composition adhésive durcissable selon la revendication 3, dans laquelle ledit (méth)acrylate contenant un cycle isocyanurate est un composé représenté par la formule (I) :

(I)

dans laquelle les A qui peuvent être identiques ou différents sont chacun un atome d'hydrogène,

ou

où R est un atome d'hydrogène ou un groupe méthyle.

5. Composition adhésive durcissable selon la revendication 4, dans laquelle tous les A sont

- 10 6. Composition adhésive durcissable selon la revendication 4, dans laquelle l'un des A est un atome d'hydrogène et les deux autres A sont $\text{CH}_2=\text{CHCO}-$.

- 15 7. Composition adhésive durcissable selon la revendication 4, dans laquelle l'un des A est $\text{CH}_2=\text{CHCOO}-(\text{CH}_2)_5\text{CO}-$ et les deux autres A sont $\text{CH}_2=\text{CHCO}-$.

8. Composition adhésive durcissable selon la revendication 3, dans laquelle ledit (méth)acrylate ayant un cycle isocyanurate est utilisé dans une quantité de 5 à 30 parties en poids par rapport à 100 parties en poids de la quantité totale desdits prépolymère polymérisable et diluant réactif.

- 20 9. Composition adhésive durcissable selon la revendication 1 ou la revendication 4, dans laquelle ledit (méth)acrylate d'oligoester a, comme squelette, un composé d'ester obtenu à partir d'un acide carboxylique aromatique, et ledit (méth)acrylate polyfonctionnel est choisi dans le groupe constitué du tri(méth)acrylate de triméthylpropane, du tétra(méth)acrylate de pentaérythritol, de l'hexa(méth)acrylate du dipentaérythritol, de l'isocyanurate de tris(méth)acryloxyéthyle, du di(méth)acrylate de 1,6-hexane-
25 diol, du di(méth)acrylate de triéthylène glycol, du di(méth)acrylate de néopentyl glycol, du di(méth)acrylate de polyéthylène glycol, du di(méth)acrylate d'hydroxypivalate de néopentyl glycol, un composé (méth)acrylaté de bisphénol A auquel est ajouté de l'oxyde d'éthylène, ou un di(méth)acrylate d'ester diglycidyle d'un acide gras dibasique contenant 4 atomes de carbone ou plus.

- 30 10. Composition adhésive durcissable selon la revendication 3 ou la revendication 9, dans laquelle ledit prépolymère polymérisable est choisi dans le groupe constitué d'un polyester insaturé, d'un (méth)acrylate d'époxy et d'un (méth)acrylate d'uréthane.

- 35 11. Composition adhésive durcissable selon la revendication 1, la revendication 3 ou la revendication 11, dans laquelle la proportion pondérale du prépolymère polymérisable et du diluant réactif est dans la gamme de 10 : 90 à 80 : 20 et l'agent d'amorçage de la polymérisation est utilisé dans une quantité de 0,2 à 20 parties en poids par rapport à 100 parties en poids de la somme du prépolymère polymérisable et du diluant réactif.
