

RADIO SELECTIVE CALLING RECEIVER**ABSTRACT**

A radio selective calling receiver includes a plurality of notification means (8,9,10), a schedule function section (12), a storage section (13), and a timepiece section (14). Each notification means (8,9,10) notifies the reception of a call signal to the receiver. The schedule function section (12) allows to input schedule time zones and icons indicating contents of schedule events in the respective time zones. The storage section (13) stores the schedule time zones and icons, which are input by using the schedule function section, in correspondence with each other. The storage section (13) also stores notification means (8,9,10), of the plurality of notification means (8,9,10), which is selected and set in correspondence with each icon indicating the contents of the schedule.
