(54) Title: HOUSING HAVING A HOLDING DEVICE ARRANGED ON A BASE PLATE

(57) Abstract

The invention relates to a housing having a holding device arranged on a base plate and comprising a circular arrangement of radially resilient clamping limbs having radially outward clamping surfaces for engagement in a central opening of at least one disc-shaped information carrier, for example a CD, rigid supporting limbs having radially outward supporting surfaces being interposed between the clamping limbs and the diameter of the circular arrangement of supporting surfaces being slightly smaller than the diameter of the central opening of the information carrier. It is an object of the invention to provide a housing of the afore-mentioned type, which allows the clamping force on the information disc to be increased without the immunity to severe impact loads being affected. To this end, the rigid supporting limbs have radially resilient clamping noses having radially outward clamping surfaces for engagement in the central opening of the disc-shaped information carrier.
