

ABSTRACT

VACUUM TOILET UNIT

A vacuum toilet comprises a toilet bowl (1), operating means (4-6) for the toilet function and an outer shell (2) enclosing both the toilet bowl (1) and the operating means (4-6).

At least a substantial portion (2, 2b) of the shell is removable without any substantial influence on the support of the bowl (1) or operating means (4-6) in order to allow servicing access to the bowl and operating means

In normal use of the toilet, substantially all of the externally applied load exerted by a user of the toilet is carried by the shell.
