

COMMUNICATION METHOD AND APPARATUS

ABSTRACT

A communication method and an apparatus are provided, to provide a solution for determining whether a terminal device is able to identify a PDU set for a specific service. A terminal device determines first indication information, where the first indication information indicates that the terminal device is able to identify a PDU set, and the first indication information is associated with one or more of the following: a first DRB, a first PDCP entity, a first QoS flow, and a first PDU session; and the terminal device sends the first indication information. A solution in which the terminal device determines, for a granularity of an XR service, whether a PDU set can be identified is provided, so that the terminal device can accurately determine, for a current XR service, whether a PDU set can be identified.
