(54) Title: VIRTUAL DISCOVERY OF CONTENT AVAILABLE TO A DEVICE

(57) Abstract: Discovering content on data streams available to a device such as a satellite radio. A satellite radio may be able to receive channels from a satellite network as well as over an IP-based network. The device can be configured to tune multiple channels selected from the channels available to the device over these networks based on the user's preferences. The user preferences can be compared to at least the metadata of the channels available to the device in order to identify the channels that best match the user's preferences. The channels identified in this manner are then tuned and recorded on the device. A user may then be notified of the recorded content.
