

ABSTRACT

An application processing method and a mobile terminal are provided. The method includes: analyzing an operation right of an application when the application executes an invoking operation for a fee deduction event; allowing the application to execute the invoking operation if the application has an operation right for the fee deduction event; and forbidding the application from executing the invoking operation if the application does not have the operation right for the fee deduction event. In the present disclosure, it is not necessary to scan an application every time the application runs. It is only necessary to determine the operation right of the application, which cuts down processing time and avoids waste of system resources, while at the same time does not require participation of the user and facilitates the user to use. In this way, the user experience is improved.
