

**Abstract:**

The invention relates to a holding part (100) which comprises, in a main direction from a lower face to an upper face of the holding part (100): - a base (200) which  
5 extends between a first end face and a second end face; - connecting means; and - a fastening portion (400) which is connected, in fixed connection, to the base (200) using the connecting means (300). The fastening portion (400) comprises a profile which extends between the two end faces, the fastening  
portion (400) defines a snap-fitting recess (401) which is configured to allow an  
10 anchoring clip to be inserted and snap-fitted in the recess, and the holding part (100) comprises cinching means which are configured to hold the base (200), by the lower face, so that it is secured to the structure.
