

Molding composition, molded parts, and method
of manufacturing molded parts

ABSTRACT OF THE DISCLOSURE

The curing time is shortened, the molding cycle is improved, and, as a result, a molding composition excellent in productivity is presented, and by using this molding composition, molded parts are manufactured at excellent productivity. A molding composition includes an unsaturated alkyd resin and an unsaturated polyester containing a crosslinking monomer, and this crosslinking monomer contains 2-hydroxyethyl acrylate or 2-hydroxyethyl methacrylate. A molded part is manufactured in (a) a step of covering the surrounding of a stator part having a heat generating coil with the molding composition, (b) a step of feeding power to the coil for generating heat in the stator part, and (c) a step of curing the molding composition by the heat generated in the stator part.
