(54) Title: METHOD AND APPARATUS FOR WIRE FORMATS FOR SEGMENTED MEDIA METADATA FOR PARALLEL PROCESSING IN A CLOUD PLATFORM

FIG. 1

(57) Abstract: A method performed by at least one processor includes segmenting a media stream into a plurality of media segments in a multidimensional space. The method includes determining respective metadata associated with each of the plurality of media segments. The method includes encapsulating a plurality of metadata into a predetermined wire format, each encapsulated metadata comprising a location or sequence associated with the each of the plurality of media segments. The method includes parallel processing the plurality of media segments based on the encapsulated metadata. The method further includes merging, after the parallel processing, the plurality of media segments into the media stream.
