

DATA INPUT ASSISTANCE SYSTEM

Abstract

A data input assistance system (1) comprises a configuration data creation system (3) and an input data display system (2). The creation system (3) creates and outputs a configuration code (C1) obtained by encoding configuration data structured with a data name of actual data to be input to a data input terminal (10) and a control code name of a control code used at the time of inputting the actual data. The display system (2) creates and displays a data input code (C2) obtained by encoding the actual data to be input to the data input terminal, on the basis of the configuration data output from the configuration data creation system (3). When the data input terminal reads a data input code (C2), the actual data which has been encoded into the data input code (C2) is input to the data input terminal (10) by using the control code.
