PACKAGING BOX FOR BOTTLES

Informant(s) : DEMOUY PEROT

Inventor (s) : Nicolas PEROT

Summary

The packaging box (1) for bottles, is made up of an opened mould that consists of a lateral surface in two identical parts (2, 3) , folded one on the other according to a generating lateral (4), in a manner to be stocked flat, completed with two identical base elements (14, 15) having the shape of a half-section of the box in an opened position and comprising each a base flap (16, 17) set to the length of its diameter, the two base flap (16, 17) being glued to one another in a way to produce an element that strengthens the base and the grip. The unfolding of the box, upon receiving a bottle, is obtained by pushing the two base elements in the lateral surface, where this piece is blocked by jamming.
